# THE NSK BRAND, RECOGNIZED AROUND THE WORLD

From home appliances, automobiles, and capital equipment to the aerospace industry – NSK bearings are used in an extensive range of applications. NSK established its global-scale enterprise on technology that has met the exact requirements of global industry. We have also established R&D systems and support services to meet the diverse needs of our customers on every continent.

As a brand recognized around the world, NSK continues to lead industry with its technical expertise.

# TERMINOLOGY

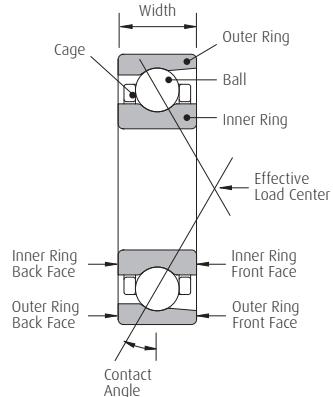

## DESIGN AND CLASSIFICATION

Rolling bearings use balls or rollers, located between bearing rings, to minimize friction. The rolling elements are separated and held in position by "cages".

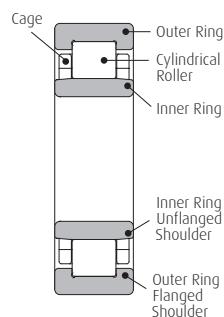

The construction of six of the most common rolling element bearings are illustrated here for identification of nomenclature. Specific dimensions and details for these bearings are given in the dimensional tables in the following sections of this catalog.

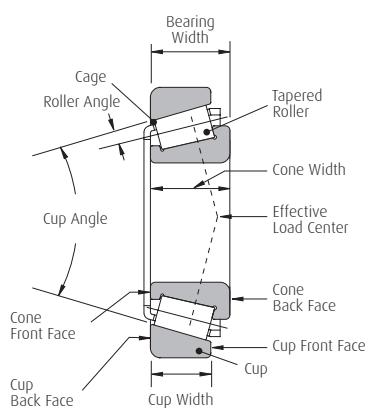

**Single Row Deep Groove Ball Bearing**

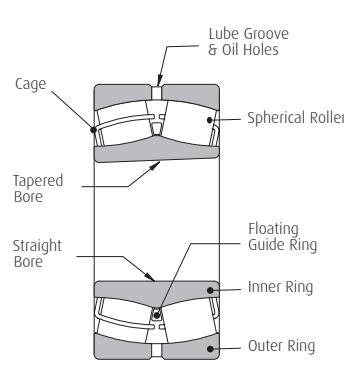

**Single Row Angular Contact Ball Bearing**

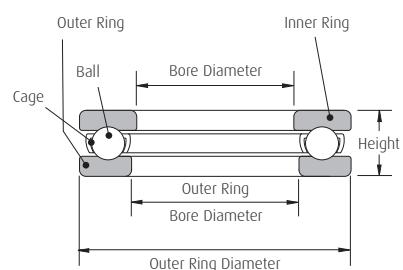

**Cylindrical Roller Bearing (NU Style)**

**Tapered Roller Bearing**

**Spherical Roller Bearing**

**Single Direction Thrust Ball Bearing**

# BEARING TYPES AND PERFORMANCE

Bearing Type	Series	Radial Loads	Axial Loads	Combined Loads	High Speeds	Angular Misalignment
	Deep Groove Ball Bearing 600-6000-6200-6300-16000-16100-6800-6900-BL	Good	Fair 2 directions	Good	Excellent	Fair
	Double Row Deep Groove Ball Bearing 4200-4300	Good	Fair 2 directions	Fair	Fair	Poor
	Angular Contact Ball Bearing 7200-7300	Good	Good 1 direction only	Good	Excellent	Poor
	Double Row Angular Contact Ball Bearing 3200-3300-5200-5300	Good	Good 2 directions	Good	Fair	Poor
	Four-Point Contact Ball Bearing QJ200-QJ300	Poor	Good 2 directions	Fair	Good	Poor
	Self-Aligning Ball Bearing 1200-1300-2200-2300	Fair	Poor 2 directions	Poor	Good	Excellent

	Cylindrical Roller Bearing NJ-NF200-300-400-1000-2200-2300	Good	Fair 1 direction only	Fair	Good	Poor
	Cylindrical Roller Bearing NUP200-300-400-1000-2200-2300	Good	Fair 2 directions	Fair	Good	Poor
	Tapered Roller Bearing HR30200-30300-30300D-J-32000-32200-32300-33000-33100-33200	Good	Good 1 direction only	Good	Fair	Poor
	Spherical Roller Bearing 21300-22200-22300-23000-23100-23200-23900-24000-24100	Excellent	Fair 2 directions	Good	Fair	Excellent
	Thrust Ball Bearing 51100-51200-51300-51400-52200-52300-52400	None	Good 1 direction only	None	Poor	None

# PRECISION CLASS

## BEARING TOLERANCE STANDARDS

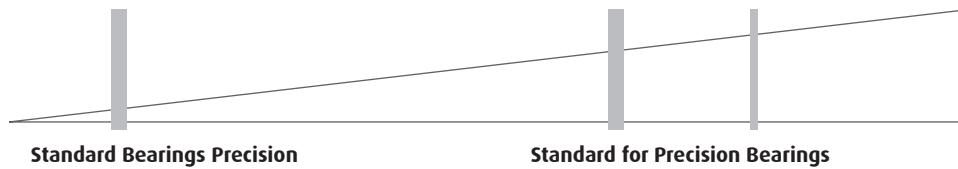

The dimensional and running accuracies of rolling bearings are standardized by ISO with regard to the following items:

- Tolerances for bore diameter, outer diameter, individual ring width, and overall width
- Tolerances for absolute dimensions of inscribed circle diameter and circumscribed circle diameter
- Tolerances for chamfer dimension
- Tolerances for width variations
- Tolerances for taper angle and taper bore diameters
- Tolerances for radial runout of inner ring and outer rings
- Tolerances for axial runout of inner and outer rings
- Tolerances for side or face runout of inner ring
- Tolerances for side or face runout of outer ring

## PRECISION STANDARDS

Equivalent Standards (reference)	JIS <sup>(1)</sup> DIN <sup>(2)</sup>	Class 0 P0	Class 6 P6	Class 5 P5	Class 4 P4	Class 3 P3	Class 2 P2
ANSI/ABMA <sup>(3)</sup>	Ball Bearings	ABEC 1	ABEC 3	ABEC 5 (CLASS 5P)	ABEC 7 (CLASS 7P)	ABEC 7/9	ABEC 9 (CLASS 9P)

	Tapered Roller Bearings	CLASS 4	CLASS 2	CLASS 3	CLASS 0		CLASS 00

<sup>(1)</sup> JIS: Standards for Japanese Industry, <sup>(2)</sup> DIN: German Institute for Standards, <sup>(3)</sup> ABMA: American Bearing Manufacturers Association.

# BEARING IDENTIFICATION

## BEARING NUMBER FORMULATION

Bearings are identified by numbers and letters which designate bearing type, boundary dimensions, tolerance class, internal clearance and other specifications. The numbers used for standard bearings conform to ISO 15, Designation of Rolling Bearings. Boundary dimensions for the most commonly used bearings are based on the ISO Boundary Dimensions Tables.

In order to establish certain standards in addition to those specified in ISO, NSK also uses various designations of its own.

Bearing Series	Bearing Type	Dimension Series	
		Width* Series	Diameter Series
<b>Single Row Deep Groove Ball Bearing</b>	68	6	(1) 8
	69	6	(1) 9
	60	6	(1) 0
	62	6	(0) 2
	63	6	(0) 3
	64	6	(0) 4
<b>Single Row Angular Contact Ball Bearing</b>	70	7	(1) 0
	72	7	(0) 2
	73	7	(0) 3
	74	7	(0) 4
<b>Self-Aligning Ball Bearing</b>	12	1	(0) 2
	13	1	(0) 3
	22	2	(2) 2
	23	2	(2) 3
<b>Single Row Cylindrical Roller Bearing</b>	NU10	NU	1 0
	NU2	NU	(0) 2

	NJ22	NJ	2 2
	NJ3	NJ	(0) 3
	NJ23	NJ	2 3
	NJ4	NJ	(0) 4
	N2	N	(0) 2
<b>Double Row Cylindrical Roller Bearing</b>	N3	N	(0) 3
	N4	N	(0) 4
	NF2	NF	(0) 2
	NF3	NF	(0) 3
	NF4	NF	(0) 4
	NNU49	NNU	4 9
	NN30	NN	2 0
	320	3	2 0
	302	3	(0) 2
	322	3	2 2
<b>Metric Tapered Roller Bearing</b>	303	3	0 3
	323	3	2 3
	230	2	3 0
	231	2	3 1
	222	2	2 2
	232	2	3 2
<b>Spherical Roller Bearing</b>	213**	2	0 3
	223	2	2 3
	230	2	3 0
	231	2	3 1
	222	2	2 2
	232	2	3 2
<b>Thrust Ball Bearing with Flat Seat</b>	213**	2	0 3
	223	2	2 3
	511	5	1 1
	512	5	1 2
	513	5	1 3
	514	5	1 4
<b>Spherical Roller Thrust Bearing</b>	522	5	2 2
	523	5	2 3
	524	5	2 4
	292	2	9 2
	293	2	9 3
	294	2	9 4

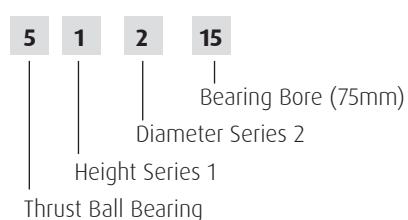

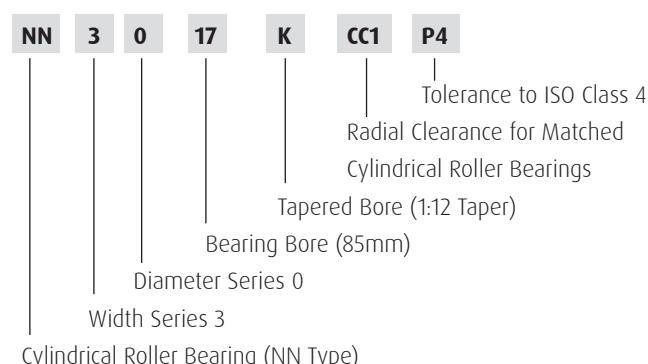

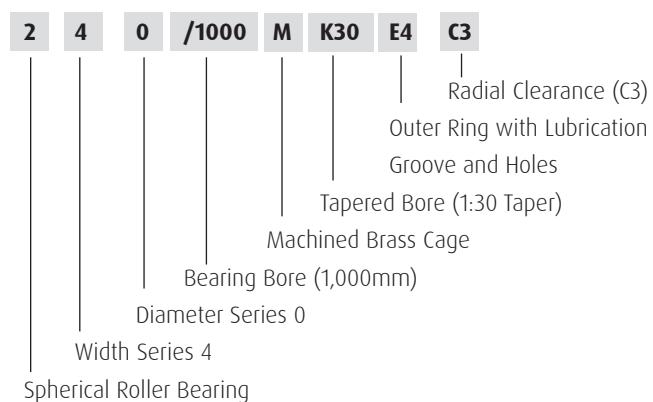

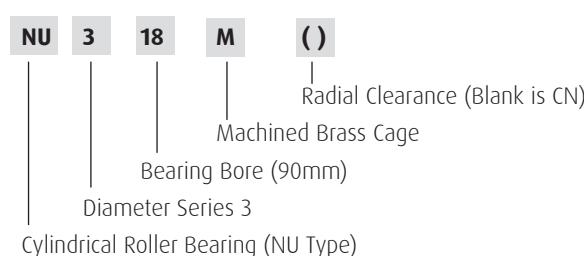

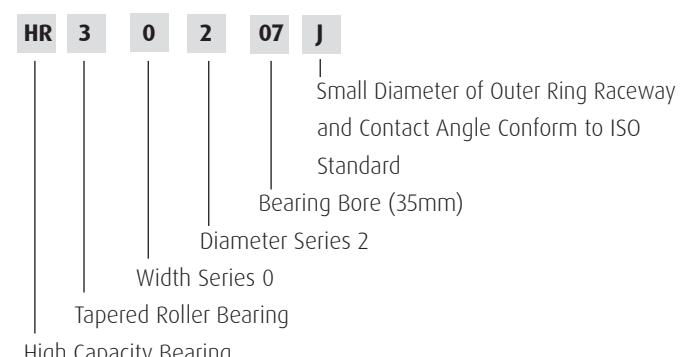

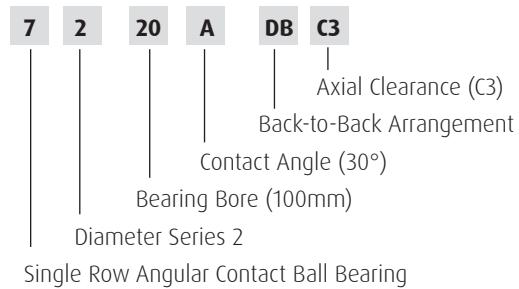

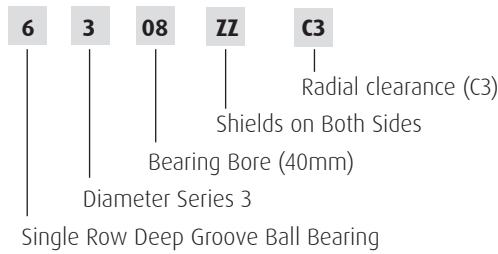

\*The width series numbers shown in parentheses are usually omitted.

\*\*213 is customary usage since this series would be 203 according to standard practice.

## BEARING NUMBER FORMULATION (CONT.)

Bearing series numbers indicate bearing types and dimension series. They constitute the basic number structure for bearing designations. These are shown on page A-7. Supplementary symbols and meanings of typical numbers and symbols are shown on page A-8.

Typical examples of bearing designations are illustrated below:

## **BEARING IDENTIFICATION (CONT.)**

## FORMULATION OF BEARING NUMBERS

Basic Bearing	Bearing Series	Bore		Bearing Series	
	Bore			68	Single Row Deep Groove Ball Bearings
	Contact Angle			69	
	Internal Design	Internal Design		60	
	Material	A	Modified Internal Design	70	Single Row Angular Contact Ball Bearings
	Cage	J	Small Diameter of Outer Ring Raceway and Contact Angle of Tapered Roller Bearings Conform to ISO (For High Capacity Bearings)	72	
	Seals, Shields	CA	Spherical Roller Bearings with Machined Cages	73	
Seals, Shields		CD	Spherical Roller Bearings with Pressed Cages	12	Self-Aligning Ball Bearings
Z	Shield on One Side Only	E	Extra Capacity Design	13	
ZZ	Z Shields on Both Sides	H	Spherical Radial and Thrust Roller Bearings with Polyamide cage	22	
DU	Contact Rubber Seal on One Side Only	HR (prefix)	Tapered Roller Bearings High Capacity	NJ 2	Cylindrical Roller Bearings
DDU	DU Seals on Both Sides	Material		N 3	
V	Non-Contact Rubber Seal on One Side Only	g	Case-Hardened Steel Used in Outer Rings, Inner Rings and Rolling Elements	NN 30	
VV	V Seals on Both Sides	h	Stainless Steel Used in Outer Rings, Inner Rings and Rolling Elements	320	Tapered Roller Bearings
Cages		Contact Angle Angular Contact Ball Bearings		322	
M	Machined Brass Cages	A	30°	323	
W	Pressed Steel Cages	A5	25°	230	Spherical Roller Bearings
T,TR	Phenolic Resin/Cages (Ball Bearing)	B	40°	222	
T	Polyamide Cages (Roller Bearing)	C	15°	223	
TYN, TIX	Polyamide Cages (Ball Bearing)	Contact Angle Tapered Roller Bearings		511	Thrust Ball Bearings with Flat Seats
V	Bearings without Cages (Cageless Ball and Rolling Bearings)	(none)	Contact Angle less than 17°	512	
		C	Contact Angle Approx. 20°	513	
		D	Contact Angle Approx. 28°	292	Spherical Roller Thrust Bearings
				293	
				294	

## FORMULATION OF BEARING NUMBERS (CONTINUED) - SUPPLEMENTARY SYMBOLS

Supplementary Features	Features	Tolerance Class					Feature Designs of Outer and Inner Ring	
	Arrangement						K	Tapered Bore (Taper 1:12)
	Radial Internal Clearance						K30	Tapered Bore (Taper 1:30)
	Tolerance Class						E4	Lubrication Groove and Holes in Outer Ring
	Special Specifications						N	Snap Ring Groove in Outer Ring
	Spacer or Sleeve						NR	Snap Ring Groove with Snap Ring in Outer Ring
	Lubrication						Arrangement	
		Tolerance Class			X28	Inner and Outer Rings Heat Stabilized for Maximum Working Temperature of 200°C	DB	Back to Back Duplex Arrangement
					S11	Spherical Bearings Heat Stabilized to 200°C	DF	Face to Face Duplex Arrangement
					P55	High Running Accuracy of Inner and Outer Rings	DT	Tandem Duplex
		Special Specifications					SU	Arrangement Single Universal - Bearings with front and back face standout adjusted to be equal
							DU	Duplex Universal (SU sold as pair)
Lubrication			Spacer or Sleeve			Radial Internal Clearance		
AKC	Exxon Andok C	+K	Bearings with Outer Ring Spacer	C2	For All Radial Ball Bearings	Clearance Less Than Normal		
AS2	Shell Alvania No. 2	+L	Bearings with Inner Ring Spacer	C0		Normal Clearance		
B32	Exxon Beacon 325	+KL	Bearings with Both Outer and Inner Ring Spacers	C3		Clearance Greater Than Normal		
SRI	Chevron SRI-2	+H	Adapter Designation	C4		Clearance Greater Than C3

				MC4		Clearance Greater Than MC3		
				MC5		Clearance Greater Than MC4		
						Clearance Less Than MC3		
						Normal Clearance		
						Clearance Greater Than MC3		
						Clearance Greater Than MC4		

# HOW TO ORDER REPLACEMENT BEARINGS

Ordering the correct replacement bearing is a critical task – but one that is not difficult if you take time to gather the right information. Just follow these steps:

## **1. Identify – the type of bearing you need to replace.**

- Ball Bearing – Single Row, Double Row, Angular Contact
- Roller Bearing – Cylindrical, Spherical, Tapered
- Thrust Bearing – Ball or Roller
- Split Pillow Block – Pillow Blocks
- Super Precision – Angular Contact Ball, Cylindrical Roller, Ball Screw Support
- Linear Motion – Linear Guides, Ball Screws, Monocarriers

## **2. Locate – the identification number on the bearing.**

Bearing identification numbers are usually located on the inner ring face, outer ring face or bearing O.D. Mounted units are identified by a number tag fastened to the unit or by a housing number cast into the housing cap. For linear products contact NSK.

## **3. Measure – if you need to.**

If a bearing identification number is not legible, you will need to determine the following:

1. Inner ring bore (inside diameter)
2. Outer ring outside diameter
3. Inner width and outer width (these may be different)
4. Shape of the bore and/or outside diameter of bearing – spherical, tapered or cylindrical
5. Envelope dimensions of the linear block and rail as well as notes on lube, sealing or special features

## **4. Record – additional relevant information.**

The more information available, the easier it will be to identify the replacement bearing needed. Record:

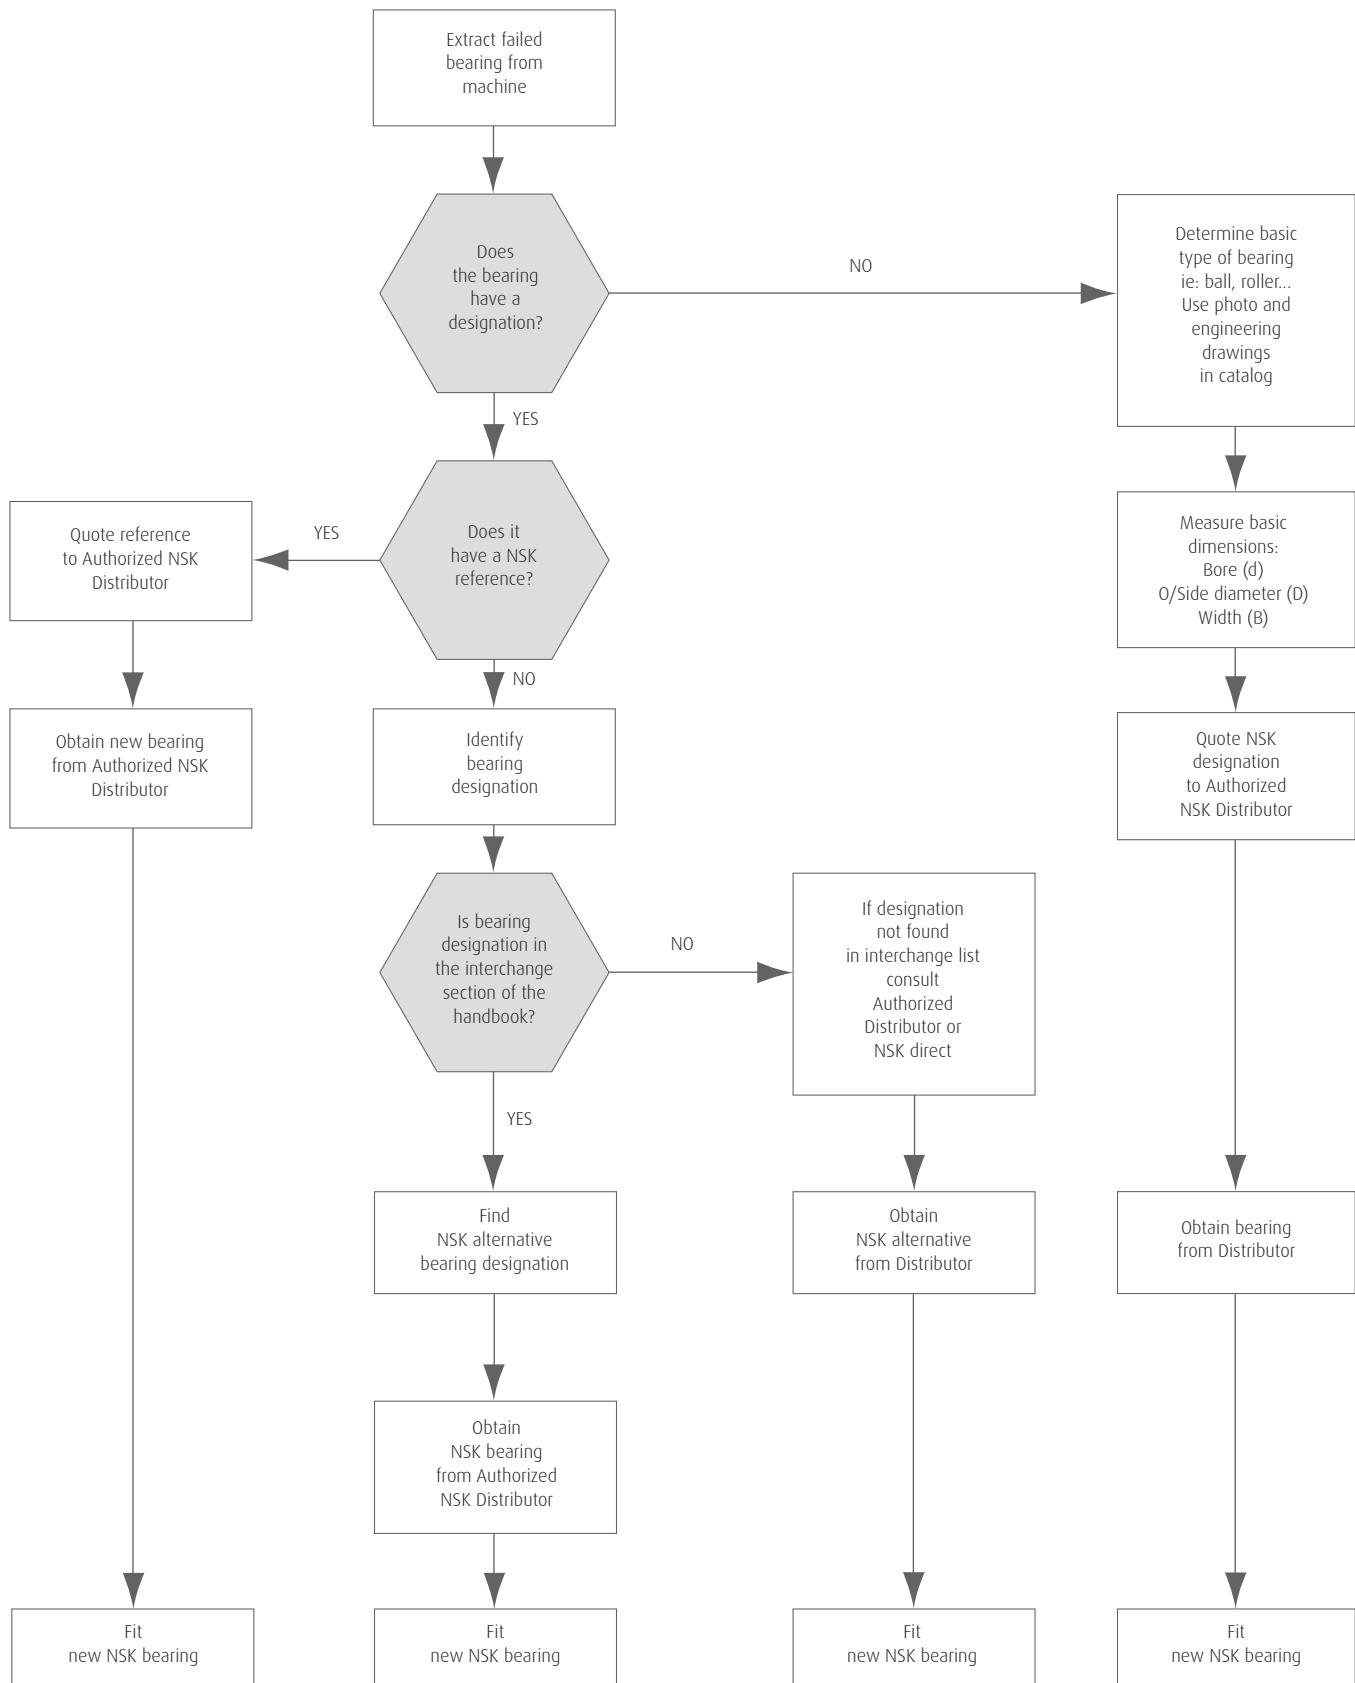

1. Unique features such as lubrication holes, snap ring grooves, machined shoulders, etc.
2. Application/equipment data

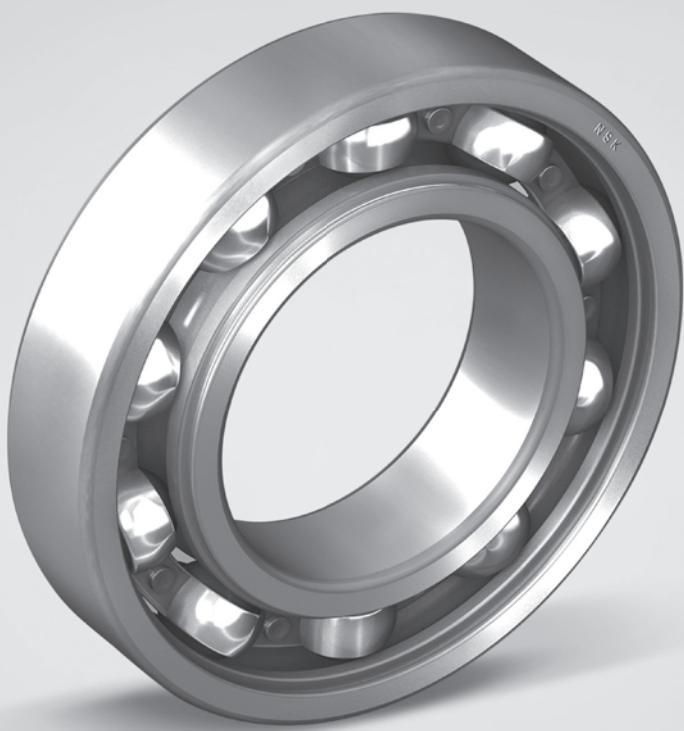

## **5. Look – in the appropriate section of the catalog.**

1. Ball Bearings
2. Cylindrical Roller Bearings
3. Spherical Roller Bearings
4. Tapered Roller Bearings
5. Thrust Bearings
6. Split Pillow Blocks
7. Super Precision Bearings
8. Linear Motion
9. Engineering

If you are still unable to identify the bearing you need, call your NSK Distributor.

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please contact NSK. NSK assumes no liability with respect to errors or omissions.

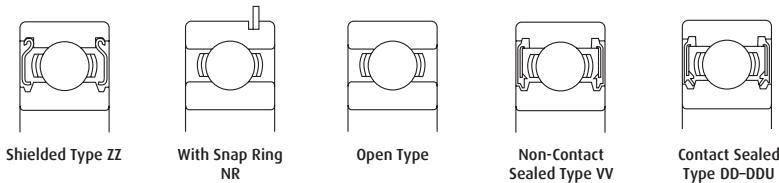

## APPLICATIONS

- › Transmissions › Electric Motors & Generators › Electrical Appliances › Pumps & Compressors › Blowers & Fans
- › Speed Changers › Gear Boxes & Drives › Woodworking Machinery › Lawn & Garden Equipment › Turbines
- › Farm Machinery › Construction Machinery › Oil Field Machinery › Elevators › Conveying Equipment › Hoists & Cranes
- › Power Hand Tools › Industrial Valves › Rolling Mill Machinery › Textile Machinery › Paper Machinery › Printing Machinery
- › Food Products Machinery › Packaging Machinery › Medical & Dental Equipment (Extra Small) › Robotics Equipment (Thin)
- › Industrial Clutches › Slip Joints › Skate Boards (608ZZ) › Inline Skates (608ZZ)

# SINGLE ROW DEEP GROOVE BALL BEARINGS

Single-Row Deep Groove Ball Bearings are classified into several types.

The proper amount of good quality grease is packed in shielded and sealed ball bearings. A comparison of the features of each type is shown below.

## FEATURES OF SEALED BALL BEARINGS

Type	Shielded Type (ZZ Type)	Non-Contact Rubber Sealed Type (VV Type)	Contact Rubber Sealed Type (DDU Type)
Torque	Low	Low	Higher than ZZ, VV types due to contact seal
Speed Capability	Good	Good	Limited by contact seal
Grease Sealing Effectiveness	Good	Better than ZZ Type	A little better than VV Type
Dust Resistance	Good	Better than ZZ Type (usable in moderately dusty environment)	Best (usable even in very dusty environment)
Water Resistance	Not Suitable	Not Suitable	Good (usable even if fluid is splashed on bearing)
Operating Temperature <sup>(1)</sup>	-10 to +110°C	-10 to +110°C	-10 to +100°C

Note: <sup>(1)</sup> The above temperature range applies to standard bearings. By using cold or heat resistant grease and changing the type of rubber, the operating temperature range can be extended. For such applications, please contact NSK.

For deep groove ball bearings, pressed cages are usually used. For big bearings, machined brass cages are used. (Refer to below table.)

Machined cages are also used for high speed applications.

## STANDARD CAGES FOR DEEP GROOVE BALL BEARINGS

Series	Pressed Steel Cage	Machined Brass Cage
68	6800 - 6838	6840 - 68/800
69	6900 - 6936	6938 - 69/800
160	16001 - 16026	16028 - 16064
60	6000 - 6040	6044 - 60/670
62	6200 - 6240	6244 - 6272
63	6300 - 6332	6334 - 6356

## MAXIMUM TYPE BALL BEARINGS

Maximum Type Ball Bearings contain a larger number of balls than normal deep groove ball bearings. A filling slot is located in the inner and outer rings. Because of their filling slots, they are not suitable for applications with high axial loads.

BL2 and BL3 types of bearings have boundary dimensions equal to those of single-row deep groove ball bearings of Series 62 and 63 respectively. Besides the open type, ZZ type shielded bearings are also available.

When using these bearings, it is important for the filling slot in the outer ring to be outside of the loaded zone as much as possible.

Their cages are pressed steel.

# SINGLE ROW DEEP GROOVE BALL BEARINGS RADIAL INTERNAL CLEARANCE

## RADIAL INTERNAL CLEARANCE IN SINGLE ROW DEEP GROOVE BALL BEARINGS UNDER NO LOAD

Units: inch

\*Maximum fillet which corner radius of bearing will clear.

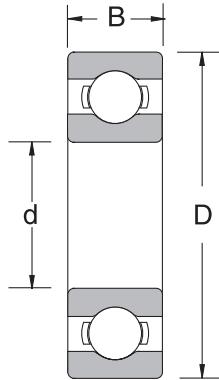

C<sub>r</sub> = Dynamical Radial Load Rating

C<sub>or</sub> = Static Radial Load Rating

Note: Limiting speeds are lower with contact seals. For more information, contact NSK.

# BALL BEARINGS: 600 SERIES

## SINGLE ROW, EXTRA SMALL

Common Options	
VV	Two Non-Contact Seals
DD	Two Contact Seals
ZZ	Two Shields
MC3	Normal Internal Clearance
MC5	Greater than Normal Internal Clearance
T1X	Polyamide Cage

# DOUBLE ROW ANGULAR CONTACT BALL BEARINGS

## Basic Type & Series

**3200:** Metric, Max Capacity, Light, 32° Contact Angle  
**3200B:** Metric, Conrad, Light, 25° Contact Angle  
**3300:** Metric, Max Capacity, Medium, 32° Contact Angle  
**3300B:** Metric, Conrad, Medium, 25° Contact Angle  
**5200:** Metric, Conrad, Light, 25° Contact Angle  
**5300:** Metric, Conrad, Medium, 25° Contact Angle

**EP**

**32**

**10**

## Contact Angle

**Blank for 3xxx Series:** 32°  
**Blank for 5xxx Series:** 25°  
**B for 3xxx Series:** 25°

**B**

**2RS**

**Cage Option**  
**J, Blank:** Steel  
**TNG:** Polyamide

**TNG**

**C3**

## Material Prefix

**EP:** Extra Pure Steel  
**Blank:** Standard Materials

## Bore Size

(04 and up: multiply last two numbers by 5 to get bore in mm)  
**00:** 10 mm  
**01:** 12 mm  
**02:** 15 mm  
**03:** 17 mm  
**04:** 20 mm

## Bearing Protection

**Blank:** Open  
**2RS:** Double Contact Seal  
**2Z:** Double Shield

## Internal Clearance

**C2:** Tight  
**Blank:** Normal  
**C3:** Greater than Normal  
**C4:** Greater than C3

Please refer to the bearing tables for exact part number options.

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please contact NSK. NSK assumes no liability with respect to errors or omissions.

## APPLICATIONS

- › Petrochemical Equipment
- › Gear Boxes
- › Centrifugal Pumps
- › Electrical Motors
- › Pumps and Compressors
- › Transmissions
- › Worm Drives
- › Blowers and Fans

Please contact NSK Engineering for internal clearance information.

$C_r$  = Dynamic Radial Load Rating

$C_{or}$  = Static Radial Load Rating

Note: Limiting speeds are lower with contact seals. For more information, contact NSK.

# SELF-ALIGNING BALL BEARINGS

## Basic Type & Series

**1200:** Metric, Self-Aligning, Extra Narrow  
**1300:** Metric, Self-Aligning, Narrow  
**2200:** Metric, Self-Aligning, Wide  
**2300:** Metric, Self-Aligning, Extra Wide  
**NLJ:** Inches, Self-Aligning, Light  
**NMJ:** Inches, Self-Aligning, Medium

**HTF**

**22**

**06**

## Material Prefix

**HTF:** High Tough  
**Blank:** Standard Materials

## Suffixes

**2RS:** Double Contact Seal  
**K:** Taper Bore 1:12  
**E:** Extra Capacity  
**NR:** Snap Ring

**2RS**

## Bore Size

(04 and up: multiply last two numbers by 5 to get bore in mm)

<b>00:</b> 10 mm	<b>04:</b> 20 mm
<b>01:</b> 12 mm	<b>05:</b> 25 mm
<b>02:</b> 15 mm	<b>12:</b> 60 mm
<b>03:</b> 17 mm	<b>20:</b> 100 mm

Inch: directly indicated

## Internal Clearance

**C2:** Tight  
**Blank:** Normal  
**C3:** Greater than Normal  
**C4:** Greater than C3

**C3**

## Cage Option

**TNG:** Polyamide  
**J:** Pressed Steel

Please refer to the bearing tables for exact part number options.

## APPLICATIONS

- › Film Processing Equipment
- › Vertical Spinning Equipment
- › Vertical Weaving Equipment
- › Industrial Countershafts
- › Paper Making – Fourdrinier

# CYLINDRICAL ROLLER BEARINGS

## Basic Type

**N:** Single Row, No Flanges on Outer Ring  
**NU:** Single Row, No Flanges on Inner Ring  
**NJ:** Single Row, One Flange on Inner Ring  
**NUP:** Single Row, One Flange Inner with Retaining Ring  
**NF:** Single Row, One Flange on Outer Ring  
**NH:** Single Row, One Flange Inner with Stabilizing Ring  
**NN/**  
**NNU:** Double Row, Flanges Outer/Flanges Inner

**STF**

**NJ**

**3**

## Material Prefix

**HTF:** High Tough  
**STF:** Super Tough  
**WTF:** Water Tough  
**Blank:** Standard Materials

## Series

**2:** Light  
**3:** Medium  
**4:** Heavy  
**10:** Extra Light  
**22:** Light, Wide  
**23:** Medium, Wide

## Bore Size

(04 and up: multiply last two numbers by 5 to get bore in mm)  
**00:** 10 mm      **04:** 20 mm  
**01:** 12 mm      **05:** 25 mm  
**02:** 15 mm      **12:** 60 mm  
**03:** 17 mm      **20:** 100 mm

**20**

**E**

## Internal Design

**Blank:** Standard Design  
**E:** High Capacity Design

**M**

**C3**

**E**

## Internal Clearance

**C2:** Tight  
**Blank:** Normal  
**C3:** Greater than Normal  
**C4:** Greater than C3

Please refer to the bearing tables for exact part number options.

## APPLICATIONS

- › Traction Motors (NH and NU) › Electric Motors, medium to large size
- › Pumps and Compressors (Centrifugal Pump, Deepwell Pump, Slurry Pump, Screw Compressor) › Plastic Forming Equipment
- › Blowers and Fans › Gears and Drives › Coal Pulverizers (NN) › Construction Equipment › Heavy Equipment
- › Machine Tool Spindle › Calender Rolls of Paper Making Machines › Transmissions › Printing Presses › Mold Oscillator Tables
- › Continuous Casters › Turbines › Crushers › Journal Boxes › Speed Reducers › Table Rollers for Steel Mills
- › Oil Field Equipment (Pump Jack)

**Cylindrical** roller bearings are designed to carry heavy radial loads and are suitable for high speed applications. Their rolling elements are ground to provide maximum contact with the raceway and are precisely crowned to avoid edge loading due to shaft misalignment.

**NU** style bearings have two machined flanges on the outer ring and no flanges on the inner ring. The rollers and cages are assembled in the outer ring. Because there are no flanges in the inner ring, this bearing cannot carry an axial load.

**N** style bearings have two machined flanges on the inner ring and no flanges on the outer ring, with rollers and cage on the inner ring. Like the NU style, the N has no axial load carrying capability.

**NJ** style bearings have two machined flanges on the outer ring and a machined flange on one side of the inner ring. The roller and cage assembly is in the outer ring. The integral flange on the inner ring allows this bearing to carry a small axial load in one direction.

**NF** style bearings have two machined flanges on the inner ring and one flange on the outer ring, with roller and cage on the inner ring. Like the NJ bearing, these bearings can carry a small axial load in one direction.

**NH** style bearings are created by combining an **NJ** style bearing with an **HJ** thrust collar. Mounted on the non-flange side of the inner ring, the thrust collar allows the bearing to carry a small axial load in both directions. The addition of the HJ collar increases the width of the bearing. Contact NSK for dimensions of the thrust collar and for preferred shoulder diameters. Bearings of this style may be designated as either an NH or NJ+HJ part number.

**NUP** style bearings have two machined flanges on the outer ring and a machined flange on one side of the inner ring. A special-design inner ring allows use of a stabilizing ring on the non-flange side. As a result, these bearings can carry a small axial load in both directions. The roller and cage assembly is mounted in the outer ring.

**Double Row** cylindrical roller bearings are denoted by two N's within the part number (e.g., **NN** or **NNU**). The dimensions for these can be found in the Super Precision section of this catalog and can be ordered with standard precision.

## INTERCHANGE

\*Indicates NSK (HPS) High Performance Standard bearing.

**Common Options**

M	Machined Brass Cage
W	Pressed Steel Cage
ET	High Capacity Polyamide Cage
CO*	Normal Internal Clearance
C3	Greater than Normal Internal Clearance
E	Electric Motor Quality

\*Indicates NSK (HPS) High Performance Standard bearing.

**Common Options**

M	Machined Brass Cage
W	Pressed Steel Cage
ET	High Capacity Polyamide Cage
CO*	Normal Internal Clearance
C3	Greater than Normal Internal Clearance
E	Electric Motor Quality

# SPHERICAL ROLLER BEARINGS

## Material Prefix

**TL:** Tough and Long Life  
**HTF:** High Tough  
**STF:** Super Tough  
**WTF:** Water Tough  
**Blank:** Standard Materials

**TL**

**230**

## Basic Type

**213xx:** Spherical Roller, Extra Heavy  
**222xx:** Spherical Roller, Heavy  
**223xx:** Spherical Roller, Extra Heavy, Wide  
**230xx:** Spherical Roller, Light  
**231xx:** Spherical Roller, Medium  
**232xx:** Spherical Roller, Heavy, Wide  
**239xx:** Spherical Roller, Extra Light  
**240xx:** Spherical Roller, Light, Wide  
**241xx:** Spherical Roller, Medium, Wide

## Bore Size

(multiply last two numbers by 5 to get bore in mm)

**20:** 100 mm    **48:** 240 mm  
**32:** 160 mm    **96:** 480 mm  
500 millimeters and larger written as:  
**/500:** 500 mm    **/710:** 710 mm  
**/630:** 630 mm    **/1000:** 1000 mm

**72**

**CAM**

## Cage Options

**CAM:** One Piece Brass, Guide Ring  
**C,CD:** Two Piece Steel, Guide Ring  
**EA:** High Capacity Steel  
**H:** Two Piece Polyamide  
**M:** Two Piece Brass, Integral Guide Flange

## Bore Type

**Blank:** Cylindrical Bore  
**K:** 1:12 Tapered Bore  
**K30:** 1:30 Tapered Bore

**K**

## Material Code

**G:** Carburized, inner and outer ring rolling element  
**G2:** Carburized, outer ring only  
**G3:** Carburized, inner ring only  
**G5:** Carburized, inner and outer rings  
**Blank:** Thru Hardened Bearing Steel

**G3**

**E4**

**C3**

## Internal Clearance

**C2:** Tight  
**Blank:** Normal  
**C3:** Greater than Normal Clearance  
**C4:** Greater than C3 Clearance

**P55S11**

## Other Features

**P52:** Outer Ring Accuracy  
**P53:** Inner Ring Accuracy  
**P55:** Both Ring Accuracy  
**U22:** Special Inspection Measure  
**S11:** Inner and Outer Ring Heat Stabilized to 200°C  
**VE:** Vibrating Equipment  
**W507:** S11, E4, W31  
**W509:** S11, E7, W31

Please refer to the bearing tables for exact part number options.

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please consult NSK Engineering. NSK assumes no liability with respect to errors or omissions.

\* Indicates NSK **HPS** High Performance Standard Bearing

## APPLICATIONS

Provided below are a few common applications for spherical roller bearings. The spherical roller bearing is designed to handle very heavy loads, even under misalignment or shaft deflection conditions. The spherical shape of the outer ring raceway allows the inner ring to tilt slightly relative to the outer ring without significant loss in bearing life. Spherical roller bearings can also handle axial loading in either direction and heavy shock loads.

- › **Continuous Casters (Support Roll, Guide Roll, Pinch Roll, Table Roll)** › **Other Metal Mill Equipment**
- › **Shaker Screens and Other Vibratory Equipment** › **Paper Making Equipment (Calender Rolls, Dryer Rolls, Fourdrinier)**
- › **Mining Equipment (Drag Lines, Gyratory Crushers, Continuous Miners, Jaw Crushers)** › **Blowers and Fans**
- › **Rubber and Plastic Forming Equipment (Extruders, Granulators)** › **Pumps and Compressors (Deep Well, Slurry)**
- › **Gears, Drives and Reducers** › **Construction Equipment** › **Oil Field Equipment (Pump Jacks, Compounds, Derricks, Hoists)**
- › **Overhead Cranes, Crane Hooks, Hoists** › **Metal Forming Equipment** › **Railroad Generators and Alternators**

\*Axial displacement values apply only to solid steel shafts or hollow steel shafts where the bore is equal to or less than one-half of the outside diameter. If the material is other than steel, or if thin wall journals are used, please consult NSK.

1:12 Taper applies to Series 213, 222, 223, 230, 231, 232, 233, 238 and 239.

1:30 Taper applies to Series 240, 241 and 242.

For Pe less than 0.13Cr, use the lower half of the reduction range. For heavier loads or Pe greater than 0.13Cr, carburized or TL inner rings should be specified and the upper half of the reduction range can be used.

## MOUNTING A BEARING USING RADIAL CLEARANCE REDUCTION

**Example:** The bearing to be mounted is a 22340CAMKE4C3 [200mm bore (40x5) with C3 clearance].

- Using feeler gauges, the clearance in the bearing measures .0090".
- From the "Reduction in Radial Clearance" column in the chart, the reduction in clearance is .0031" to .0039". Subtract these numbers from the measured clearance.

Measured Clearance	.0090"	.0090"
Reduction	<u>.0031"</u>	<u>.0039"</u>
Mounted Clearance	.0059"	.0051"

- Bearing is installed by one of the recommended methods until the clearance in the bearing is within the mounted clearance range. For best results, mount bearing at the middle of the range.

\*Maximum fillet which corner radius of bearing will clear.

**COMMON OPTIONS**

TL	Tough & Long Life
HTF	High Tough
STF	Super Tough
CAM	One Piece Brass Cage
C,CD	Two Piece Steel Cage
EA	High Capacity Steel Cage
H	Two Piece Polyamide Cage
K	1:12 Tapered Bore
G3	Inner Ring Carburized
E4	Lube Groove/Holes, Outer Ring
CO*	Normal Internal Clearance
C2	Tight Internal Clearance
C3	Greater than Normal Internal Clearance
P55	High Running Accuracy Both Rings
S11	Heat Stabilized to 200°C
VE	Vibrating Equipment

\*Not shown in part number  
See page D-1 for additional options.

\*Maximum fillet which corner radius of bearing will clear.

**COMMON OPTIONS**

TL	Tough & Long Life
HTF	High Tough
STF	Super Tough
CAM	One Piece Brass Cage
C,CD	Two Piece Steel Cage
EA	High Capacity Steel Cage
H	Two Piece Polyamide Cage
K30	1:30 Tapered Bore
G3	Inner Ring Carburized
E4	Lube Groove/Holes, Outer Ring
CO*	Normal Internal Clearance
C2	Tight Internal Clearance
C3	Greater than Normal Internal Clearance
P55	High Running Accuracy Both Rings
S11	Heat Stabilized to 200°C
VE	Vibrating Equipment

\*Not shown in part number  
See page D-1 for additional options.

# METRIC TAPERED ROLLER BEARINGS

**STF**

**Material Prefix**

- HTF:** High Tough
- STF:** Super Tough
- WTF:** Water Tough
- Blank:** Standard Materials

**Prefix**

- HR:** High Capacity
- Blank:** Normal Capacity

**HR**

**322**

**Series**

30200	32200
30300	32300
31300	32900
32000	33000
	33100
	33200

**10**

**C**

**J**

**Bore Size**

(04 and up: multiply last two numbers by 5 to get bore in mm)

**02:** 12 mm    **08:** 40 mm

**03:** 17 mm    **10:** 50 mm

**04:** 20 mm    **20:** 100 mm

Special bore sizes are as follows:

**/22:** 22 mm    **/32:** 32 mm

**/28:** 28 mm

**Interchangeability**

**J:** Cup Angle and Raceway Diameter Conform to ISO 355

**X:** Dimension Series 32000 and 32900 the Major Dimensions Conform to ISO 355

**Contact Angle**

**Blank:** Standard Angle = 15° to 17°

**C:** Medium Angle = 17° to 24°

**D:** Steep Angle= 24° and more

Please refer to the bearing tables for exact part number options

Suffix	Medium Contact Angle	C	B	B	B
	Steep Contact Angle	D	--	--	--
	Boundary Dimensions Conform to ISO 355	X	X	X	X
	Conforms to ISO 355	J	--	--	A

\*HR313xx is directly equal to HR303xxD.

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please contact NSK. NSK assumes no liability with respect to errors or omissions.

## APPLICATIONS

Shown below are some common applications utilizing a tapered roller bearing design. The design allows for combinations of heavy radial and thrust loads with low to moderate speeds. This section covers only single row tapers although NSK manufactures a full line of two and four row tapers as well. For more details on multiple row tapered roller bearings, please contact an NSK representative.

Metric designs function the same as their inch series cousins, the difference lies in the units of measure. NSK metric tapers are standardly supplied with cup and cone together, while inch series bearing are available by the cup, cone, or cup and cone. The applications shown below are for either metric or inch bearings, with the equipment manufacturer choosing the preference of dimensional measurements. Metric tapers are usually found in equipment designed in Europe or Asia.

- › Guide Boxes in Bar and Rod Mills › Pumps and Compressors › Cranes and Hoists › Gears and Drives › Stamping Presses
- › Machine Tool Spindles › Bow Thrusts on Ships › Speed Reducers › Transmissions › Sheaves › Conveyor and Transfer Equipment
- › Construction Equipment › Mining Equipment › Oil Field Equipment › Automotive Front and Rear Axles › Plastic Forming Equipment
- › Agriculture Equipment › Motorcycle Wheels › Pinion Shafts of Differential Gears › Drum Shafts › Crankshafts › Crushers

# INCH TAPERED ROLLER BEARINGS

## Prefix

- EH:** Extra Heavy
- EL:** Extra Light
- H:** Heavy
- HH:** Heavier than Heavy
- HM:** Heavy Medium
- L:** Light
- LL:** Lighter than Light
- LM:** Light Medium
- M:** Medium

**STF**

**LM**

**1**

## Basic Series

1-3 digit number that identifies maximum bore range

**19**

**49**

## Additional Features\*

- R:** Conforms to ABMA Standard
- G:** Case Carburized Cups & Cone

\*NSK uses these two standard suffixes.  
Either one or two letter suffixes may appear.

**R**

## Material Prefix

- HTF:** High Tough
- STF:** Super Tough
- WTF:** Water Tough
- Blank:** Standard Materials

## Code Included Cup Angle

- |                                      |                 |
|--------------------------------------|-----------------|
| <b>1</b> 0                           | to 23°59'59.99" |
| <b>2</b> 24°                         | to 25°29'59.99" |
| <b>3</b> 25°30'                      | to 26°59'59.99" |
| <b>4</b> 27°                         | to 28°29'59.99" |
| <b>5</b> 28°30'                      | to 30°29'59.99" |
| <b>6</b> 30°30'                      | to 32°29'59.99" |
| <b>7</b> 32°30'                      | to 35°59'59.99" |
| <b>8</b> 36°                         | to 44°59'59.99" |
| <b>9</b> 45° up, but not thrust only |                 |

## Design Number

2 digits which identify the cup or cone

Please refer to the bearing tables for exact part number options

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please contact NSK. NSK assumes no liability with respect to errors or omissions.

## APPLICATIONS

Shown below are some common applications utilizing a tapered roller bearing design. The design allows for combinations of heavy radial and thrust loads with low to moderate speeds. This section covers only single row tapers although NSK manufactures a full line of two and four row tapers as well. For more details on multiple row tapered roller bearings, please contact an NSK representative.

Metric designs function the same as their inch series cousins, the difference lies in the units of measure. NSK metric tapers are standardly supplied with cup and cone together, while inch series bearing are available by the cup, cone, or cup and cone. The applications shown below are for either metric or inch bearings, with the equipment manufacturer choosing the preference of dimensional measurements. Metric tapers are usually found in equipment designed in Europe or Asia.

# BALL THRUST BEARINGS

## Basic Type & Design

- 51:** Ball Thrust, Single Direction
- 52:** Ball Thrust, Double Direction
- 53:** Ball Thrust, Single Direction, with Aligning Seat
- 54:** Ball Thrust, Double Direction, with Aligning Seat

53

2

## Series

- 1:** Extra Light
- 2:** Light
- 3:** Medium
- 4:** Heavy

## Bore Size

(04 and up: multiply last two numbers by 5 to get bore in mm)

- |                  |                   |
|------------------|-------------------|
| <b>00:</b> 10 mm | <b>04:</b> 20 mm  |
| <b>01:</b> 12 mm | <b>05:</b> 25 mm  |

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please contact NSK. NSK assumes no liability with respect to errors or omissions.

## APPLICATIONS

The ball thrust bearings are designed to handle thrust loads while operating at high speeds. These bearings can be ordered with an aligning seat and aligning washer if misalignment or deflection can not be avoided.

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please contact NSK. NSK assumes no liability with respect to errors or omissions.

## APPLICATIONS

Listed below are popular applications for the spherical roller thrust bearings. Also available, but not shown, are cylindrical roller thrust bearings (TMP) and tapered roller thrust bearings (TT, TTF or V-Flat). Please consult an NSK representative for more information.

The spherical roller thrust bearings are designed to handle very heavy thrust loads in one direction while operating at low to moderate speeds. The design of the spherical roller thrust will also allow for some radial load while thrust load is imposed. The spherical shape of the outer ring raceway makes these bearings excellent for handling misalignment.

## APPLICATIONS

Tapered roller thrust bearings contain tapered rollers. TT type bearings, which have a rib on the housing washer, can accurately guide the shaft in the radial direction. TTF – type bearings, which have no rib on the housing washer, can tolerate some eccentricity during operation.

## APPLICATIONS

Cylindrical roller thrust bearings contain cylindrical rollers. They can sustain only axial loads, but they are suitable for heavy loads and have high axial rigidity. The cages are machined brass.

Ball or Spherical Roller Bearings with  
Adapter Sleeves  
**6xx:** Housings use Tapered Bore Self-Aligning  
Ball or Spherical Roller Bearings with  
Adapter Sleeves

**517**

Indicated on adapter type mounting  
arrangement for 000 K Series.  
Example: SDAF23064K/11-1/2

**K**

**11 - 1/2**

Shaft size. Only used for Pillow Block  
units in 000 K Series

Please refer to the bearing tables for exact part number options

## APPLICATIONS

NSK Pillow Blocks are designed for exceptional performance in a wide range of applications. The pillow blocks are manufactured in a wide variety of sizes out of heavy-duty cast iron. They are also available in ductile and cast steel as an option. NSK pillow blocks are tremendous at keeping water and contaminants away from the bearing while keeping lubrication inside the housing. The housing comes standard with a triple-ring labyrinth seal; but for applications where contamination is a greater concern, taconite seals are available.

NSK Pillow Blocks are completely interchangeable with other manufacturers units.

- › General Industry (Conveyors, Roller Tables, Fans and Blowers)
- › Steel Mills (Runout Tables, Strip Processing Lines)
- › Processing Industry (Crushers, Hammer Mills, Ball and Rod Mills, Decanters, Kilns)
- › Paper Making Equipment (Dryer Cans, Jack Ladders, Chip Conveyors, Pumps, Pulpers, Breast Rolls, Press Rolls)

## ACCESSORIES

**LER Standard Labyrinth Seal**

The LER is a popular standard labyrinth seal for SAF blocks.

**LER-DC Dust Cover/Wiper Seal for LER or PER Seals**

LER-DC Dust Cover/Wiper Seal can be used with both LER or PER seals. It provides an additional barrier and flinger for contaminants. The housing's machined face provides for an ideal contact for the wiper seal to shroud seal area and create an additional labyrinth. The LER-DC in combination with the PER and PER-PTV seal, provides optimum protection for low speed application in harsh environments.

**PER Labyrinth with O-Ring**

The PER interchanges completely and includes an O-ring shaft seal for a snug fit on the shaft. The O-ring will cause the PER to generally spin on the shaft.

**PER-PTV-Ring Seal for use with PER Labyrinth**

PER-PTV-ring is a lip contact seal installed over the PER and within the housing seal grooves. The PTV-ring seal allows the grease to slowly purge creating a barrier for contaminants. The lip contact seal can be reversed to also retain grease for applications where contamination is of less concern or access for re-lube is difficult.

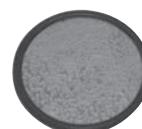

**TER Taconite with V-Ring Face Seal**

The TER taconite seal is available in two versions...one with a V-ring face seal and the other with an oil seal as a shaft contact seal. Both include a felt shaft seal and an O-ring seal for the housing side to provide a tight yet flexible fit.

**TER-OS Taconite Seal with Oil Seal**

**EPR End Cover**

The EPR end cover seals one end of the housing.

**OLB Seal**

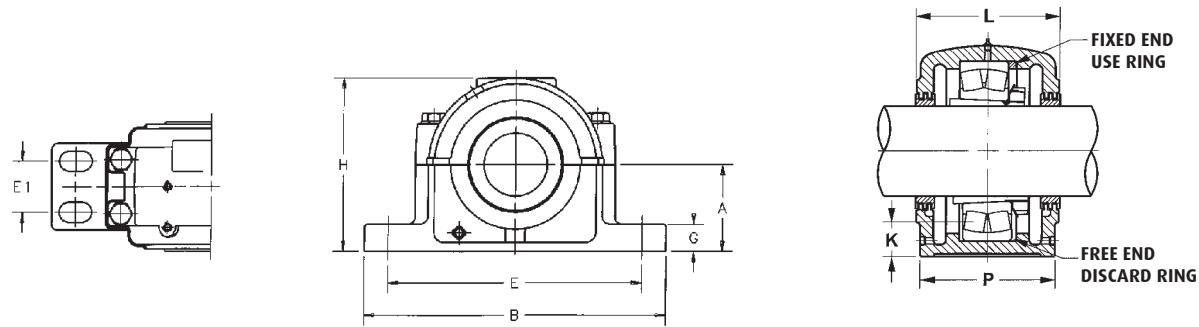

The OLB seal is an advanced solution that's uniquely designed to keep water and contaminants out while keeping clean bearing lubrication inside the housing.

Note: Housings available in cast iron (SAF), Ductile (SAFD) or cast steel (SAFS).  
Taconite (TER) and LOR seals with O-rings are also available.

<sup>(a)</sup> "Housing Only" includes cap, base, capbolts, labyrinth seals and fixing rings.

<sup>(b)</sup> Fixing Ring is used for fixed block only; do not use for float mounting.

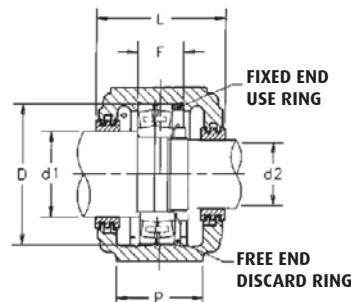

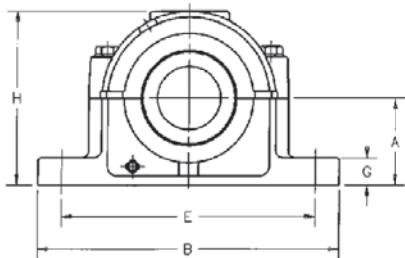

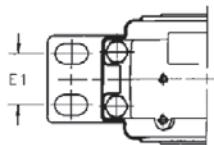

<sup>(c)</sup> End Cover is optional.

\*TYN cage replaces TY, TR cage replaces T. Sealed (V1V) versions are a new option and P4Y tolerance specification replaces P4. P4Y tolerance specification has tighter bore and OD control than ABEC 7 (class 4 or P4). NSK supplies the following bearing series with P4Y tolerance: 7000; 7200.

\*\*Indicates prefix not suffix.

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please contact NSK. NSK assumes no liability with respect to errors or omissions.

## APPLICATIONS

Super Precision Angular Contact ball bearings are specifically designed for rigid, high-speed, high-precision machine tool spindles. Their state-of-the-art preload control assures consistent high performance. Super Precision Angular contacts are also available with seals – contact NSK for details.

## LIMITING SPEEDS

The limiting speeds listed in the Bearing Dimensional Tables are guideline values. They are based on a single bearing that is lightly preloaded by means of a spring and subjected to a relatively light load with good heat dissipation.

The limiting speeds with grease lubrication are determined using high quality grease in appropriate amounts. Those listed for oil lubrication are based on the use of oil-air (or oil mist) lubrication. In situations where the lubricating oil is used as a means to remove heat, higher speed can be achieved, however a large amount of oil must be pressure fed through the bearing, so there is significant loss of spindle power.

When single bearings are used in two, three or four row combinations, or the preload is increased to improve spindle rigidity, limiting speeds will be lower than those listed by the factors in the table below.

\*D<sub>b</sub> is housing diameter for low shoulder

\*\*r<sub>b</sub> is housing fillet radius for low shoulder

For application limiting speed, please refer to page H-2.

Note: When a ceramic ball is used, limiting speed value will be 1.25 times the value of the steel ball.

\*D<sub>b</sub> is housing diameter for low shoulder

\*\*r<sub>b</sub> is housing fillet radius for low shoulder

For application limiting speed, please refer to page H-2.

Note: When a ceramic ball is used, limiting speed value will be 1.25 times the value of the steel ball.

#### COMMON OPTIONS

TR	Phenolic Cage
TYN	Polyamide Cage
DU	Duplex Universal
SU	Single Universal
L	Light Preload
M	Medium Preload
H	Heavy Preload
P4	ISO 4 (ABEC 7) Precision
P4Y	NSK Exclusive P4 Accuracy
V1V	Non-contacting Seal
SN24	Ceramic Rolling Element

\*D<sub>a</sub> is housing diameter for low shoulder

\*\*r<sub>b</sub> is housing fillet radius for low shoulder

For application limiting speed, please refer to page H-2.

Note: When a ceramic ball is used, limiting speed value will be 1.25 times the value of the steel ball.

\*BNR has replaced BNC series. P4Y tolerance specification replaces P4. P4Y tolerance specification has tighter bore and OD control than ABEC 7 (class 4 or P4). NSK supplies the following bearing series with P4Y tolerance: 7000; 7200; 7900; and BNR.

\*\* Indicates prefix not suffix

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please contact NSK. NSK assumes no liability with respect to errors or omissions.

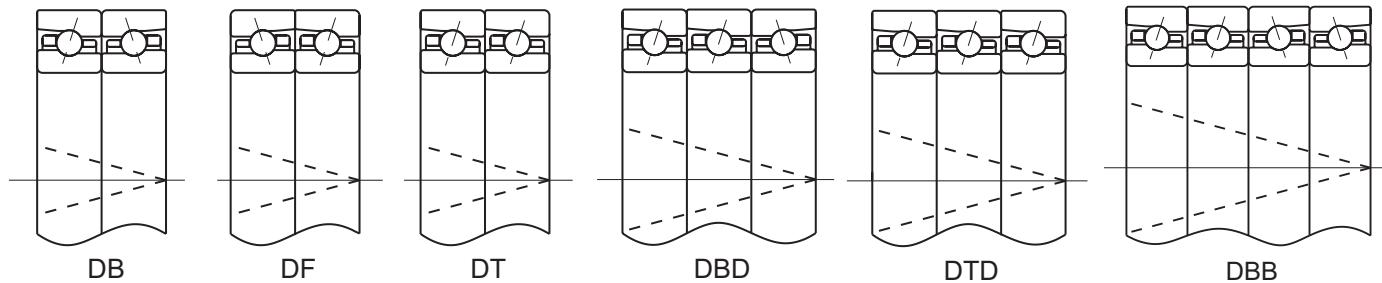

## APPLICATIONS

High Speed Super Precision Angular Contact ball bearings are now available due to NSK's new optimized design, under the ROBUST name. Allowing increased speeds and improved performance, these series are available in applications specific designs for machining center applications (BNR), and high speed grinding applications (BGR) - both allowing customers to push the limits of existing speeds.

\*BAR and BTR series have replaced BA and BT series.

\*\* Indicates prefix not suffix

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please contact NSK. NSK assumes no liability with respect to errors or omissions.

## APPLICATIONS

Super Precision Angular Contact Thrust bearings are designed to work together with high speed super precision cylindrical roller bearings where high speed, and high rigidity are required. Offered in a 30° and 40° series, this offering allows flexibility for meeting the rigidity requirements seen in many machine tool applications.

### › Lathes

## FEATURES

All of these bearings have special outside diameter tolerances (P4A and P2A) to provide clearance between the outer ring periphery and housing bore in order to avoid supporting radial loads.

\*The outer ring machined lubrication groove and holes (E44) is now a standard feature. TB cage replaces T cage, MB replaces M and KR replaces K.

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please contact NSK. NSK assumes no liability with respect to errors or omissions.

## APPLICATIONS

Super Precision Cylindrical roller bearings are designed to specifically handle large radial loads in high speed applications. They are available in a variety of designs, including double row and single row options, to suit various applications. In addition, a standard lube groove and hole feature is available along with tapered and non-tapered bores. When combined with Super Precision Angular Contact Thrust bearings, the Super Precision Cylindrical meets the high rigidity requirements of many machine tool spindle applications

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please consult NSK Engineering. NSK assumes no liability with respect to errors or omissions.

## APPLICATIONS

Ball Screw Support bearings are designed specifically to provide maximum axial rigidity and improved feeding accuracy for use with precision ball screws. They are high accuracy angular contact thrust bearings, which are superior to combinations of standard angular contact bearings or arrangements of radial and thrust bearings for ball screw applications. Both Metric and Inch series are available.

› Precision Ball Screws › Rolled Ball Screws › Heavy Duty Ball Screw Support Units

# BALL SCREW SUPPORT BEARINGS

## NSK HPS BSBD SERIES

Please refer to the bearing tables for exact part number options

### INTERCHANGE

Part No.	Description	Interchange	
		NSK	INA
	Double row thrust angular contact ball bearing	BS	ZKL
Part Number Suffix	Flanged bearing type	F	F
	Nonflanged bearing type	N	N
	DDU contact type triple lip seals	DDU	-2RS
	ISO class 2 running accuracy	P2B	BLANK/-PE
	Single bearing	BLANK	BLANK
	Matched pair	DT	-2AP

The competitive manufacturers are provided for a convenient source of unit substitution. They can be considered interchangeable in most instances, but for special applications, please consult NSK Engineering. NSK assumes no liability with respect to errors or omissions.

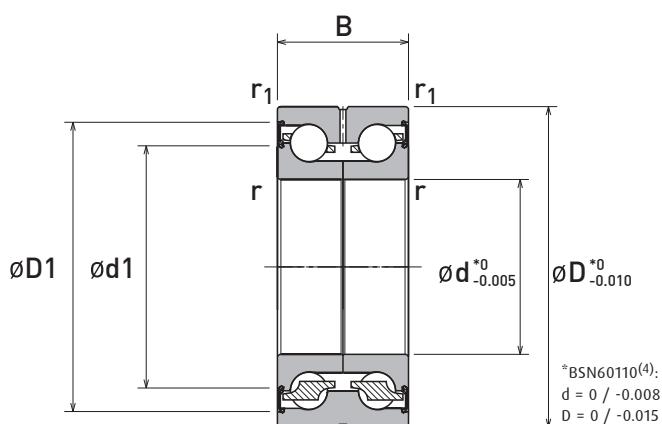

### APPLICATIONS

NSK's BSBD series of support bearings for ball screw drives are designed to meet the demanding requirements of modern machine tools, where ball screws must accurately position a work piece or machine component quickly and efficiently. A double row configuration, with a 60° contact angle, enables the bearings to support large axial forces in both directions with accuracy and rigidity. The bearings are supplied sealed, greased for life and ready for easy installation for both housing mounting (BSN type) and direct mounting (BSF type).

› Precision Ball Screws › Rolled Ball Screws › Heavy Duty Ball Screw Support Units

<sup>(1)</sup> Starting torque indicates torque due to the preload of the bearing only. If you need further information please consult NSK.

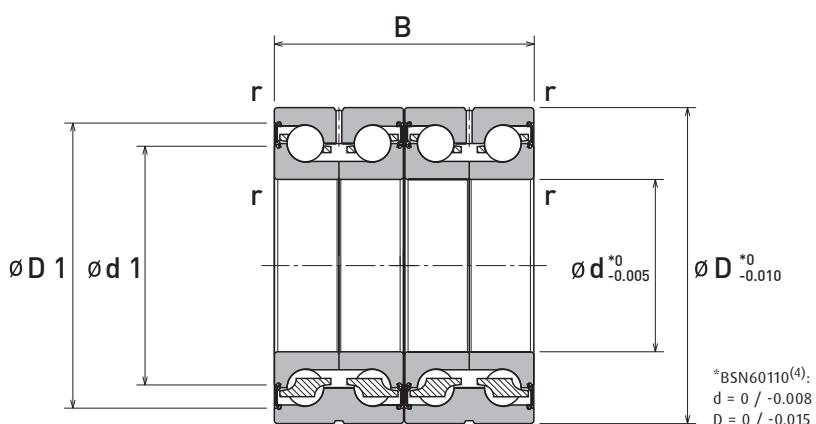

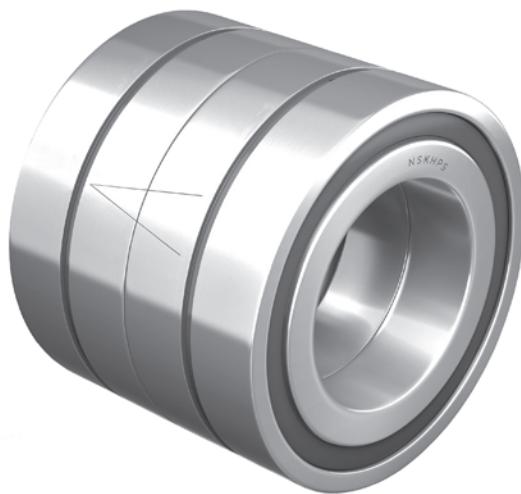

<sup>(2)</sup> Heavy series

<sup>(3)</sup> Limiting axial load is defined as the maximum load whose large contact ellipse between the ball and raceway does not cause overriding of the shoulder of the raceway groove

<sup>(4)</sup> Tolerances are valid for all sizes except for sizes mentioned in the sketch

# LINEAR GUIDES

Linear Guides are designed for high precision motion and control applications. They provide greater rigidity and higher load capacity than shaft and bushing designs.

The LH & LS Series (except sizes LH08, 10, and 12) have been discontinued and replaced by NSK's next generation NH and NS Linear Guide series, which are dimensionally interchangeable with the LH and LS series, respectively. The NH and NS Linear Guides have an improved internal design that increases load ratings, lowers noise, improves smoothness, and increases high-speed capabilities.

The NH and NS Linear Guides are completely interchangeable with the LH and LS series, respectively. When replacing individual LAH or LAS sliders (carriages), the new NAH or NAS sliders (carriages) can be installed on the existing NSK L1H or L1S rails.

Some of the industries served - machine tool, robotics, medical and aerospace - require smooth travel and high accuracy.

## APPLICATIONS

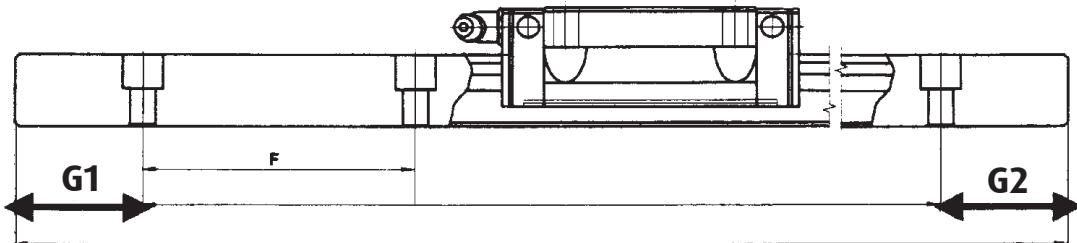

- › **Machine Tool (CNC, EDM, Laser Cutting, Water Jet, Lathes)** › **Woodworking (Routers)** › **Glasscutting** › **Testing Equipment**
- › **Medical (Diagnostic Equipment, Lab Automation, Genomics, Biotechnology)** › **CMM** › **Factory Automation**
- › **Semiconductor (Wafer Handling, PCB Drilling, LCD Etching, Testing Equipment)**

# LINEAR GUIDE PRODUCT SELECTION TIPS

To help in the selection of linear guides, NSK has come up with a series of questions that need to be asked in order to determine the appropriate NSK product.

- What is the application?
- What is the NSK or competitor parts number?
- What type of carriage or bearing style is needed for this application: Tapped or Through Hole, Square or Flange style?
- What is the rail length required for this application?
- How many carriages or bearings are needed per rail?
- Are there any special accuracy and preload requirements?
- What are the loading conditions of the application? Please provide both Static & Dynamic loads.
- What are the delivery requirements?
- Can you provide us with a drawing of the part to be purchased?
- Lubrication Method - Is the K1™ lubrication system of interest for this application?
- What is the G dimension of rail?

**G Dimension Information:** A G dimension is required to assure proper mounting to existing application. The G dimension is the measurement from start of the rail to the center of the first bolt hole. In instances where rail will be butted together, please contact NSK for assistance.

# ASSEMBLY AND MOUNTING

## ASSEMBLY

Interchangeable ball slides are shipped on (disposable) plastic provisional rails as shown in Fig I.1.

1. Wipe off anticorrosive oil from the rail.
2. All NSK slides come prepacked with Alvania 2 (AS2) grease for quick installation.
3. Align the rail with the bottom and side faces of the provisional rail while pushing the provisional rail lightly against the rail, slide the ball slide on the rail (Fig I.1).

**Fig I.1 Assembly of Ball Slide with Rail**

## MOUNTING METHOD

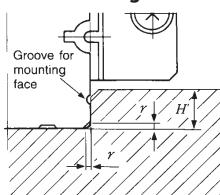

### Shoulder Height and Corner Shape at Mounting Face

When utilizing the reference surface to secure rail or ball slides to machine components the components must have the mounting face height ( $H'$ ,  $H''$ ) and corner chamfer ( $r$ ) dimensions as listed in table below and illustrated in Figs. I.2 and I.3, to avoid interference.

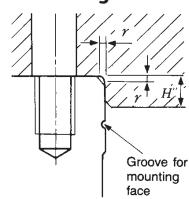

### Shoulder Height and Corner Shape at Mounting Face

Product No.	Radius of corner $r$ (max)	Shoulder Height of Rail $H'$	Shoulder Height of Ball Slide $H''$
15	0.5	4.0	4.5
20	0.5	4.5	5.0
25	0.5	5.0	5.0
30	0.5	6.0	6.0
35	0.5	6.0	6.0
45	0.7	8.0	8.0
55	0.7	10.0	10.0
65	1.0	11.0	11.0

**Fig I.2 Rail Datum Face Mounting Part**

**Fig I.3 Ball Slide Datum Face Mounting Part**

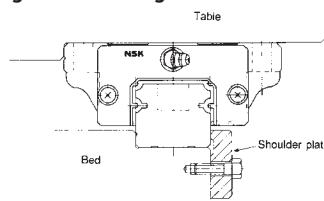

## MOUNTING PROCEDURE

### For Cases where Datum Surface Exists on the Bed

1. Lightly tighten the rail mounting bolts and then use the shoulder plate to secure rail datum surface against bed mounting surface (See Fig. I.4).
2. Tighten rail mounting bolts to their recommended torque value (see table below). Tighten the bolts in an order which enables the wrench to help push the rail against the mounting surface (see Fig. I.5 for example).

**Fig I.4 Positioning of Rail**

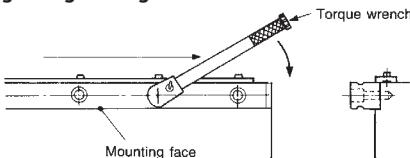

**Recommended Torque for Rail Mounting Bolt (Case of Thermally Refined Bolt)**  
unit: kgf · cm

Bolt Nominal No.	Torque	Bolt Nominal No.	Torque
M3	10.8	M10	440
M4	25.0	M12	770
M5	52.0	M14	1240
M6	88.0	M16	2000
M8	220.0	--	--

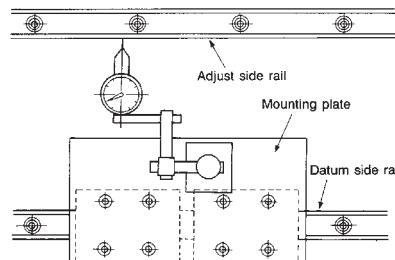

[1 kg · cm=0.8681 lb in]

**Fig I.5 Tightening Direction**

3. Mount the adjust side rail, as shown in Fig. I.6, while checking rail parallelism. For the jig shown in Fig. I.6, stability will be improved by mounting it to a ball slide.

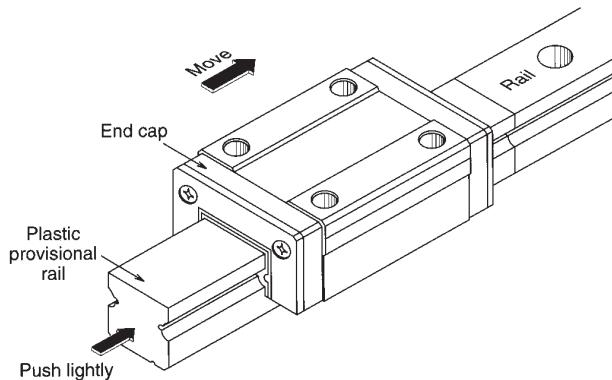

**Fig I.6 Parallelism Measurement with Jigs**

4. If dowel pins are being used they should be installed at this step.
5. Position the ball slides at specified intervals and mount the table gently.
6. Tighten ball slide mounting bolts of datum side while pushing the table so that the table and ball slide mounting reference surfaces are in contact.

## INDICATION OF INSTALLED STANDARD SIDE

The datum face of each rail is indicated by a groove in the datum face or by an arrow mark on the end or top surface of the rail.

Model Material	PU Series (all models)	PU12, 15
High-Carbon Steel		
Stainless Steel		

## Notes on Usage

Separately packaged ball slide is mounted on a plastic temporary axis (disposable) as shown at left.

1. Wipe rust preventative oil from the rail.
2. Product is ready for immediate use. Comes prepacked with Alvania 2 (AS2) grease.
3. Note the groove mark which identifies the datum faces of ball slide and rail above.
4. Align the rail with the bottom and side faces of the provisional rail while pushing the provisional rail lightly against the rail, slide the ball slide on the rail (Fig I.1).

## Lubrication

### Grease Lubrication

NSK linear guides are packed with Alvania 2 (AS2) grease and can be used as delivered. The replenishment frequency is recommended to be once a year, but adjust the interval depending on the operational conditions.

### To Change Direction of Grease Fitting

1. Remove the grease fitting with a wrench.
2. Wind some sealing tape on the thread of the fitting, then insert it and tighten. Be careful not to over torque when tightening into the side of the plastic bearing end cap.

### Change of Fitting Position in Front/Back Direction

1. Remove the plug from the grease fitting mounting hole face B shown in Fig. I.1 with a hexagonal wrench.
2. Remove the grease fitting from face A and screw into hole face B.
3. In place of the removed fitting, insert the plug into the hole in the face A.

### Change Grease Fitting Position to Side Surface

To mount the grease fitting on the end cap side face, or on the ball slide face, please consult NSK.

### Oil Lubrication

Oil piping can be connected to the tapped hole from where the grease fitting was removed. The recommended lubrication oil supply quantity per ball slide per hour Q is given by the following formula, where N is the rail width number.

$$Q = N \frac{(\text{ml}/\text{hr})}{150} \quad (5)$$

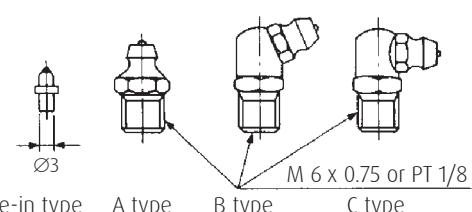

Using NH45 as an example, N=45, and

$$Q = \frac{45}{150} = 0.3(\text{ml}/\text{hr})$$

### Grease Fittings for NSK Ball Slides

Type	Linear Guide Model #	Grease Fitting Part #	Thread Spec.
Drive	NH15, NS15, LW17	L50010000-301	Dia. 3mm

(1) Applies only to model No. NH15, NS15 and LW17.

# GREASE

## NSK GREASE UNIT

Replenish grease to NSK linear guides and ball screws by a manual type hand grease pump. Install the grease in bellows tube to the pump. Several types of grease (80 g) are available.

Grease in a bellows tube

## COMPOSITION OF NSK GREASE UNIT

Components and grease types are shown below.

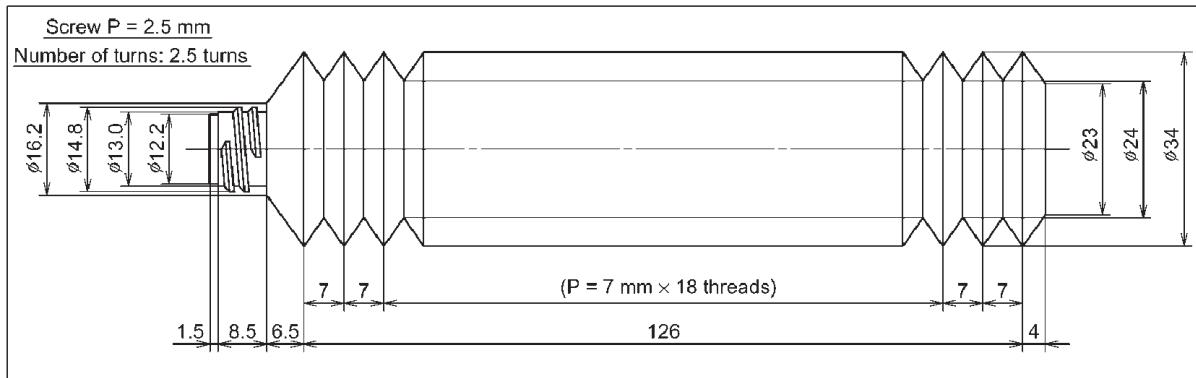

Name	(tube type)	Reference Number
NSK Grease (80 g in a bellows tube)	NSK Grease AS2 (Brown)	NSK GRS AS2
	NSK Grease PS2 (Orange)	NSK GRS PS2
	NSK Grease LR3 (Green)	NSK GRS LR3
	NSK Grease LG2 (Blue)	NSK GRS LG2

NSK straight extension pipe	NSK HGP NZ7

## NSK GREASES (80 G IN A BELLows TUBE)

Bellows tube

## NSK MANUAL GREASE PUMP UNIT

**NSK Hand Grease Pump Unit  
(Reference number: NSK HGP)**

### Features

- Light-weight ..... Can be operated by one hand yet there is no worry of making a mistake.
- Inserting by high pressure ..... Insert at 15 Mpa.
- No leaking ..... Does not leak when held upside down.
- Easy to change grease ..... Simply attach the grease in bellows tube.
- Remaining grease ..... Can be confirmed through slit on the tube.
- Several nozzles ..... Five types of nozzles to choose from.

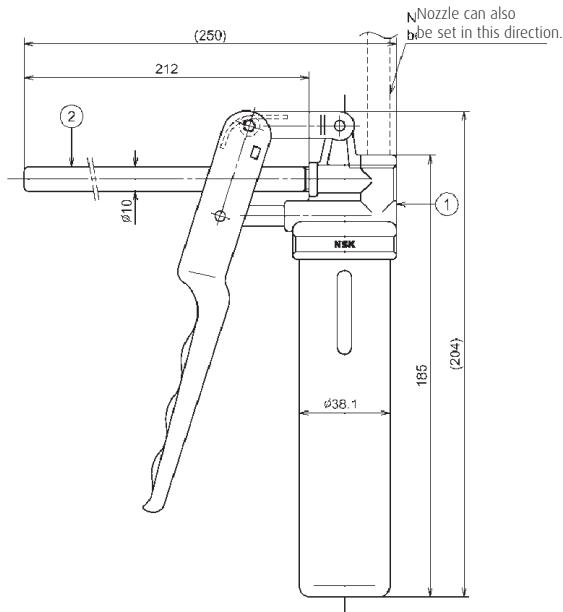

Fig I.7 NSK Hand Grease Pump with NSK straight nozzle

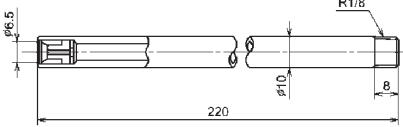

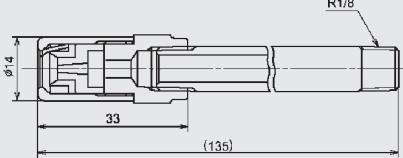

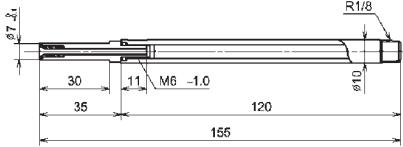

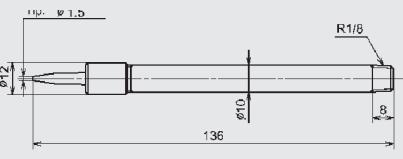

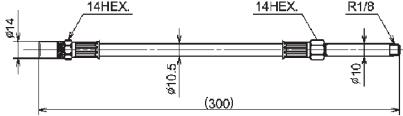

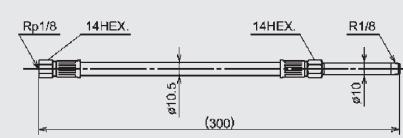

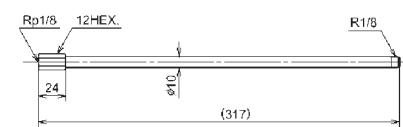

### Specifications

- Spout volume ..... 0.35 g/stroke
- Mass of main body ..... 393 g
- Overall length ..... About 200 mm
- Overall width ..... About 200 mm
- Grease tube outer diameter ..... Ø38.1
- Accessory ..... Several nozzles for a unique application can be attached

# GREASE (CONT.)

## NOZZLES

### Nozzles that can be attached to NSK Hand Grease Pump

Name	Designation Code	Use	Dimensions
NSK straight nozzle	NSK HGP NZ1	Can be used with grease fitting A, B, and C under JIS B1575 standard.	
NSK chuck nozzle	NSK HGP NZ2	Can be used with grease fitting A, B, and C under JIS B1575 standard.	
NSK fitting nozzle	NSK HGP NZ3	Dedicated for the drive-in grease fitting.	
NSK point nozzle	NSK HGP NZ4	Used for linear guides and ball screws which do not have grease fitting. Used to supply grease directly to the ball grooves, or through the opening of ball slide or ball slide to inside.	
NSK flexible nozzle	NSK HGP NZ5	Tip of nozzle is flexible to supply grease in the areas where hand cannot reach.	
NSK flexible extension pipe	NSK HGP NZ6	Flexible extension pipe connects the grease pump and the nozzle.	
NSK straight extension pipe	NSK HGP NZ7	Straight extension pipe connects the grease pump and the nozzle.	

## GREASE LUBRICANT FOR LINEAR GUIDES AND BALL SCREWS

Type	Thickener	Base Oil	Base Oil Kinematic Viscosity cSt (40°C)	Range of use Temperature (°C)	Purpose
AS2	Lithium type	Mineral oil	130	-10 ~110	For general use at high load.
PS2	Lithium type	Synthetic oil + mineral oil	15	-50 ~110	For low temperature and high frequency operation.
LR3	Lithium type	Synthetic oil	30	-30 ~130	For ball screws at high speed, medium load.
LG2	Lithium type	Mineral oil + synthetic hydrocarbon oil	30	-20~70	For clean environment.
NF2	Urea composite type	Synthetic oil + mineral oil	27	-40~100	For fretting resistance.

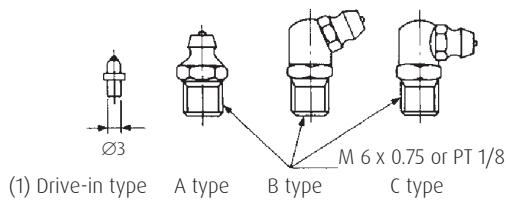

## GREASE NOZZLE USED FOR NSK LINEAR GUIDE

Linear Guide Model	Tap Hole for Grease Fitting	Standard Grease Fitting	Straight Nozzle NZ1	Chuck Nozzles (two) NZ	Drive-in Nipple Nozzles NZ3	Point Nozzle NZ4	Flexible Nozzle NZ5
NS15	Ø3	Drive-in type			0		
NS20~35	M6 x 0.75	B type	0	0			0
NH15	Ø3	Drive-in type			0		
NH20~35	M6 x 0.75	B type	0	0			0
NH45~85	PT1 / 8	B type	0	0			0
LW17	Ø3	Drive-in type			0		
LW21~35	M6 x 0.75	B type	0	0			
LW50	PT1/8	B type	0	0			0
PU09~15	-	None (1)			0 (2)		0
PE09~15	-	None (1)			0 (2)		

1) PU and PE Series: Apply grease directly to ball groove, etc. using a point nozzle.

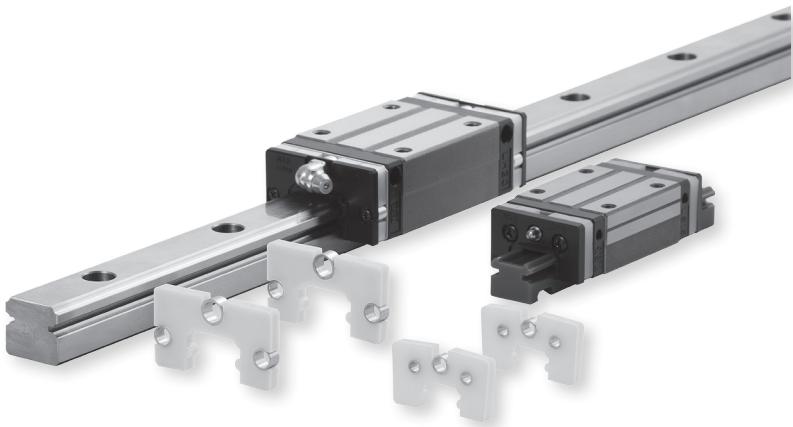

2) NS20, NS25, NH20: Use straight nozzle. (Point nozzle tip cannot be used because it interferes with the rail top surface).

## FIGURES OF GREASE FITTINGS

# K1™ MAINTENANCE-FREE LUBRICATION SYSTEM

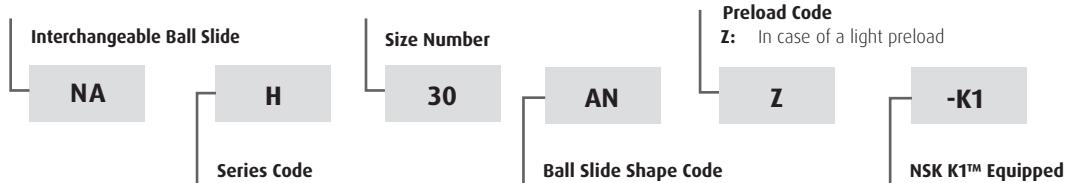

## K1™ MAINTENANCE-FREE LUBRICATION SYSTEM

## K1™ IDENTIFICATION NUMBER

Refer to the following numbering system when ordering.

Example:

The NSK K1™'s distinctive capabilities as a compact and efficient oil-impregnated lubrication unit greatly increases the performance of the Linear Guide. The K1™ Lubrication Unit is available in two types, one for industrial applications and one for food and medical devices where cleanliness and safety are paramount.

## FEATURES

### Long-term, Maintenance-Free Usage.

In mechanical environments where lubrication is difficult to apply, long-term running efficiency is maintained by using the NSK K1™ in combination with grease.

### Prevention of Oil-Related Environmental Pollution.

In locations where oil greatly affects the environment, or in mechanisms with severe hygiene restrictions, sufficient lubrication is provided using the NSK K1™ in combination with grease.

### Effective in Environments where the Lubricant is Washed Away.

In facilities where mechanisms are washed down with water, or subject to severe environmental conditions, long service life is ensured by using the NSK K1™ in combination with grease. Especially effective under hygienic conditions where oil must not be dispersed.

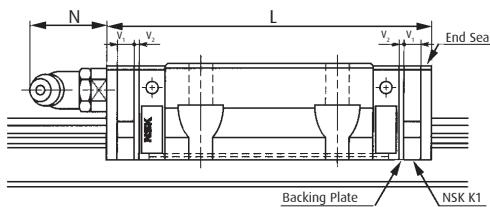

### Maintains Efficiency in Dusty Environments.

In environments where oil and grease-absorbing dust is produced, long-term efficiency is maintained by using the NSK K1™ in combination with grease.

# K1™ MAINTENANCE-FREE LUBRICATION SYSTEM (CONT.)

## K1™ LUBRICATION UNIT HANDLING AND ASSEMBLY INSTRUCTIONS

### Handling Instructions

To maintain the NSK K1™ unit's high efficiency over a long period of time, please follow these instructions:

1. Permissible temperature range Max. operating temperature: 50°C (122°F) Max. peak temperature: 80°C (176°F). If not installed immediately, they should be kept refrigerated. Avoid storage in direct sunlight.
2. Never leave the linear guide in close proximity to grease-removing organic solvents such as hexane, thinners, etc. Never immerse the linear guide in kerosene or rust preventative oils which contain kerosene.

### Note

Other oils such as: water-based cutting oil, oil-based cutting oil, grease (mineral oil-AS2, ester-PS2) present no problems to the K1™ lubricating unit's performance.

## ASSEMBLY INSTRUCTIONS FOR THE K1™ LUBRICATING UNIT FOR LINEAR GUIDES

1. Slide linear bearing on to the linear rail, using the plastic provisional rail supplied.
2. Remove the grease fitting from the end of the bearing.
3. Remove the Phillips screws (2 pieces).
4. Remove the end seal from end of bearing.
5. Install threaded plug from K1™ kit (or see option 9 and 10 depending on application).
6. Install the cover plate from the K1™ kit, to the end of bearing, against the end cap.
7. Install K1™ lubricating unit without fixing rings, so it can be expanded over the rail.
8. Put the three (3) fixing rings in position on the K1™ lubricating unit.
9. Replace the end seal, in front of the K1™ lubricating unit.
10. Install connector screw for grease fitting.
11. Replace the grease fitting in connector screw.
12. Install the **extension** Phillips screws (2 pieces, supplied with the K1™ unit kit).

Note: The K1™ lubricating unit has a shelf life. They should be installed immediately upon receipt. It is important to avoid direct sun light and extreme heat conditions.

# PRECISION GROUND BALL SCREW

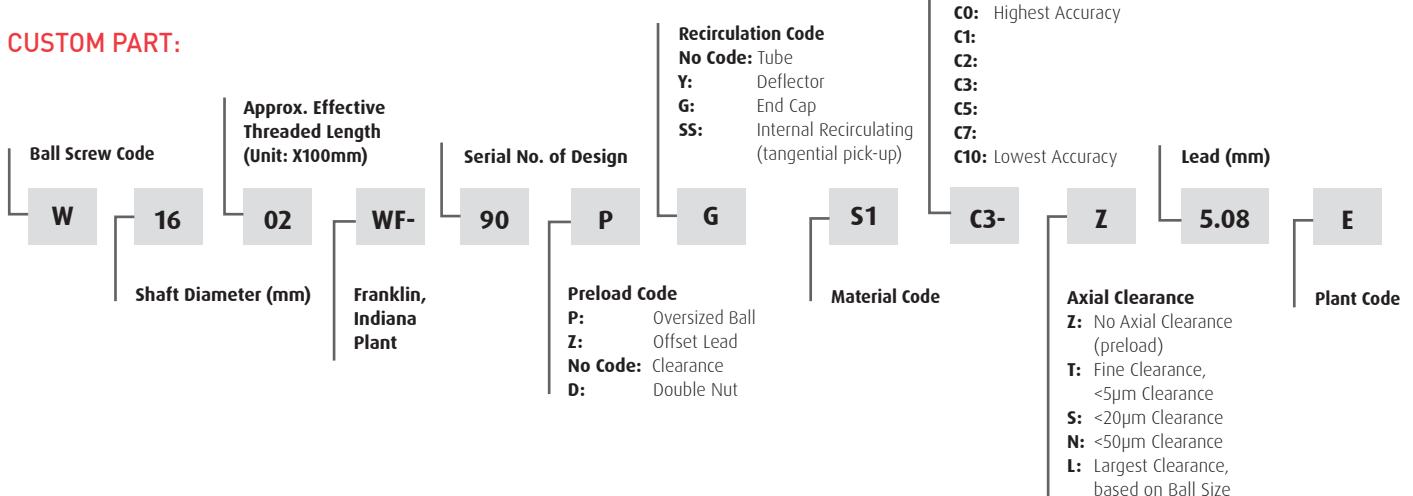

Precision Ground Ball Screws are designed to ensure smooth, precise travel, reduced wear and longer life. NSK is the leading producer of these precision products. Custom designs can be ordered for demanding applications.

- In addition to standard ground Ball Screws, NSK offers a complete line of custom Precision Ground Ball Screws.
- NSK also offers a wide variety of either Flange or Square style Ball Screw Support Unit kits.

## CUSTOM PART:

- NSK offers a wide variety of standard "off the shelf" ball screw support unit kits.
- NSK's standard line of both metric and inch series precision ground ball screws are manufactured to either a C3 or C5 accuracy grade.

# BALL SCREW SPECIFICATION SHEET FOR NEW APPLICATIONS

Detailed data is required in order for NSK to properly provide a ball screw specification. Please utilize the below sheet for gathering ball screw data. Page can be photocopied and faxed to NSK with details.

# COMPACT FA QUICKSHIP BALL SCREWS

Compact FA Series ball screws incorporate NSK's internal ball recirculation system and offer quiet, high-speed performance. In order to respond quickly to a wide range of needs, NSK offers quick-ship delivery on common sizes. These high-performing ball screws are ready for use in a variety of industries including: semiconductor manufacturing, food, medical equipment, factory automation and general industrial use.

## FEATURES

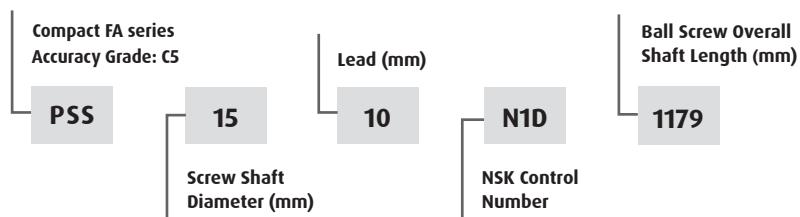

### Quick Delivery

Manufacturing in the USA and comprehensive stocking program ensure quick-ship delivery and reduced shipping costs.

### Compact Ball Screw

The outside diameter of the ball nut is as much as 30% smaller than those of existing NSK products. Compact size enables equipment and devices, such as linear stages, to be smaller. NSK has also designed low profile support units, specific for the Compact FA series, enabling a unique space-saving design.

## EXAMPLE OF STANDARD PART REFERENCE NUMBER

### Quiet Operation

The noise level has been reduced by 6 dB, about half of what is sensed by the ear.

### High-Speed Operation

Speeds up to 5000 RPM dramatically expands the range of service conditions.

### Grease Fitting provided as Standard Equipment

Lubrication ports are provided in two locations to facilitate maintenance. The ball screws can be easily connected to an integrated lubrication system.

### Contact Seal

Compact, thin plastic seal is available and helps to maintain a clean work environment, minimizes grease dispersion and reduces contamination entry.

# ROLLED BALL SCREW

## R SERIES

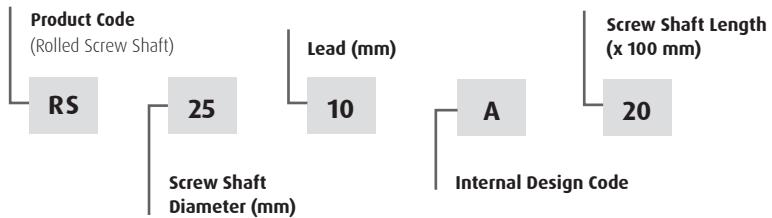

### REFERENCE NUMBER

Reference number of rolled ball screw is described below. Please use reference number to order, or for a price inquiry

### NUT ASSEMBLY (EXAMPLE)

### SCREW SHAFT (EXAMPLE)

## PRODUCT CLASSIFICATION

NSK rolled ball screws are classified by nut model as shown in table below.

### CLASSIFICATION OF ROLLED BALL SCREWS

Nut Model	Nut Shape	Recirculation System	Lead Classification
RNFTL		Flanged, Tube projecting type	Return tube type  Fine, medium lead High helix lead
RNFBL		Flanged Circular	Return tube type  Fine, medium lead
RNCT		V-thread (no flange) Projecting tube type	Return tube type  Fine lead
RNSTL		Square type	Return tube type  Small, medium lead
RNFCL		Flanged Circular	End cap type  High helix lead Ultra high helix lead

### FEATURES

- Short delivery time: R Series is standardized, and available in stock.
- Interchangeable screw shaft and ball nut: Screw shaft and nut assembly components are sold separately, and randomly matched. The maximum axial play after assembly is shown in the dimension tables.
- Low prices: Screw shaft is processed by rolling. This is why prices are lower than those of precision types.
- Abundant series: There are 128 types of nut assembly combinations in the series. Each combination has two to three different lengths in screw shaft.

### ACCURACY

- Lead accuracy: Ct10 grade ( $U_{300}=0.210$ ). Refer to "Technical Description: Lead Accuracy" for details.
- Axial play: Varies with internal specification. Refer to the dimension tables.
- Run out of screw shaft center: Ct10 grade

### NUT INSTALLATION

Refer to "Technical Description: Installation".

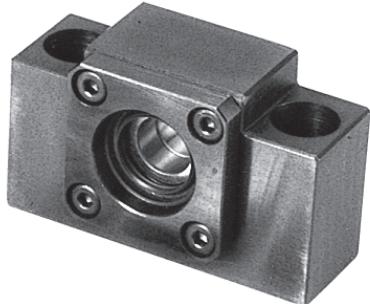

### SHAFT END MACHINING

It is necessary to machine screw shaft end of the rolled ball screw. Refer to "Configuration of rolled ball screw shaft end" if you use standard support unit. Refer to "Technical Description: Shaft end machining" for procedures and precautions.

### RUST PREVENTION

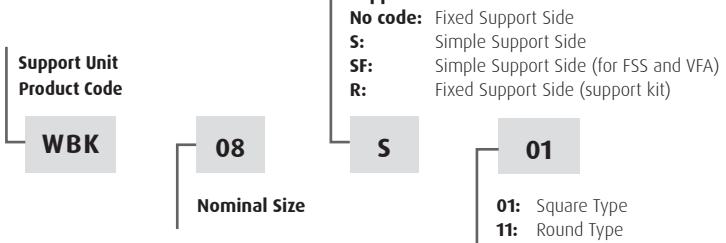

Rust prevention agent is applied at time of delivery. But special surface treatment is not given to these ball screws. NSK furnishes treatment such as phosphate coating or electrolysis low temperature chrome plating on request.

# BALL SCREW SUPPORT UNITS

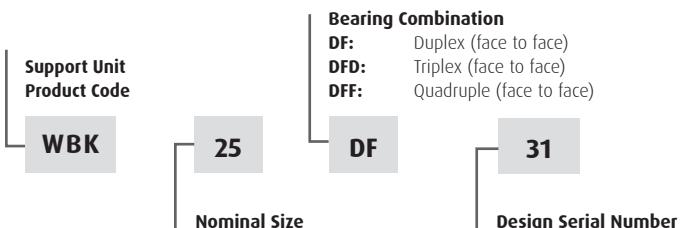

## REFERENCE NUMBER AND APPLICABLE BALL SCREW

### For Light Load

### FOR HEAVY LOAD

## SUPPORT UNITS

### Classification

Ball Screw support units are categorized by their shape. Select the type that is appropriate for you to use.

### Features

- NSK Bearings Inside:
  - General Use: Fixed support side units use Angular Contact Ball Bearings for rigidity and low friction torque.
  - Heavy Load/Machine Tool: Fixed support side units use Thrust Angular Contact bearings for greater rigidity and load capacity.
- Low Friction Torque: To minimize friction torque a deep groove ball bearing with a shield on both sides is used on the simple support side.
- High Dust Prevention: Oil seal is installed in small clearance on the fixed support side.
- Lock Nut: A fine grade lock nut is provided to fix bearing with high precision.
- Short Delivery Time: Standard items in stock.

## SUPPORT UNIT CATEGORIES

Application	Shape	Support Side	Bearing in Use	Bearing Bore Bearing Seat Diameter
Small equipment, light load	WBK**-01*	Fixed support side	Angular contact ball bearing	$\varnothing 6 - \varnothing 25$
	WBK**S-01*	Simple support side	Deep groove ball bearing	$\varnothing 6 - \varnothing 25$
	WBK**SF-01*	Simple support side	Deep groove ball bearing	$\varnothing 12, \varnothing 15$ (FSS type or VFA type)
Round	WBK**R-11 (support kit)	Fixed support side	Deep groove ball bearing (arranged to have angular contact)	$\varnothing 4, \varnothing 6$ (exclusive for RMA and RMS types)
	WBK**-11*	Fixed support side	Angular contact ball bearing	$\varnothing 6 - \varnothing 25$
Machine tools, heavy load	WBK**DF*-31	Fixed support side	Thrust angular contact ball bearing	$\varnothing 17 - \varnothing 40$

# MONOCARRIER™

## FEATURES

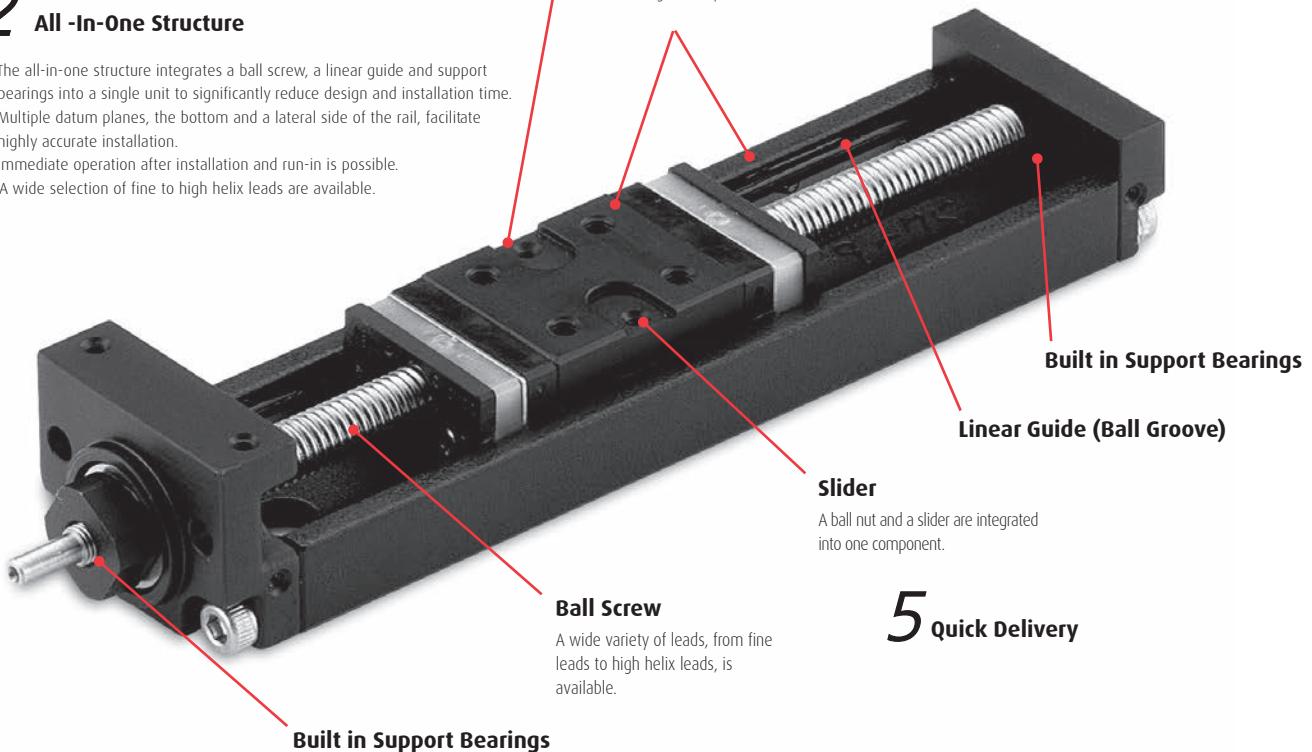

NSK's Monocarrier™ is the culmination of technology and innovation in linear motion. This lightweight, compact single axis linear actuator integrates quality NSK ball screw, linear guide and support bearings into one unit.

### 1 Light Weight, Compact Design

- Available in two different shapes of cross-section, depending on application.  
Light weight type: MCM Series  
Rigid type: MCH Series

### 2 All -In-One Structure

- The all-in-one structure integrates a ball screw, a linear guide and support bearings into a single unit to significantly reduce design and installation time.
- Multiple datum planes, the bottom and a lateral side of the rail, facilitate highly accurate installation.
- Immediate operation after installation and run-in is possible.
- A wide selection of fine to high helix leads are available.

### 4 Long Term Maintenance Free

- Use of NSK K1™ Lubrication Units and grease maintains a smooth lubricating performance for long periods in mechanical environments where lubrication is difficult to apply, where use of oil is not permitted because of hygienic issues, or where the mechanical equipment is subjected to frequent wash downs.
- NSK K1™ lubrication unit is available for food processing machines and medical equipment.
- Grease for clean environments and for general machinery is available.

### 3 Superb Antirust Capability

- Low temperature chrome plating is a standard feature for the bodies and sliders to control rusting in normal operating and storing environments. Fluoride low temperature chrome plating is optionally available for much higher rust prevention.

### 5 Quick Delivery

A Monocarrier™ is a single axis unit that combines a ball screw, a linear guide, and a support bearing unit, for ease of design and assembly on a machine. Both MCM and MCH type Monocarriers™, equiped with NSK K1™ lubrication unit, (which enables long term maintenance free operation) are a standard feature.

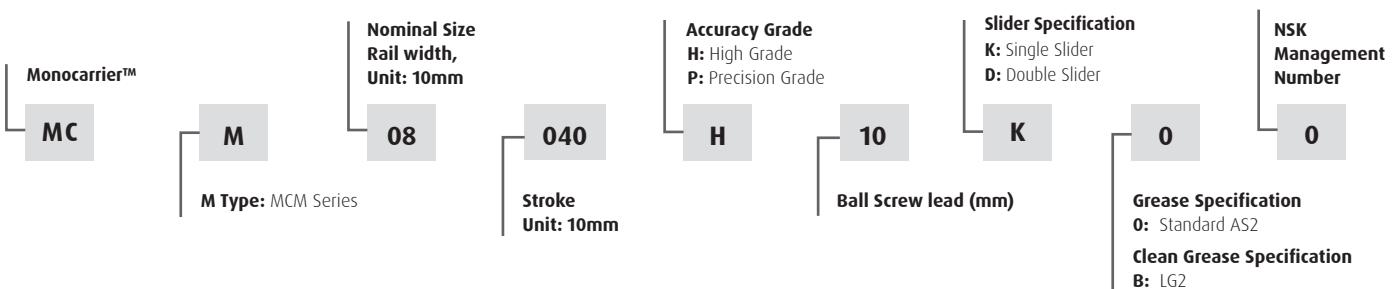

## APPLICATIONS

- › Automotive Manufacturing Equipment › Manufacturing Machine for Semiconductors and Liquid Crystal Displays
- › Food Processing / Medical Equipment › Optical / Glass Working Equipment › Telecommunication Manufacturing Equipment

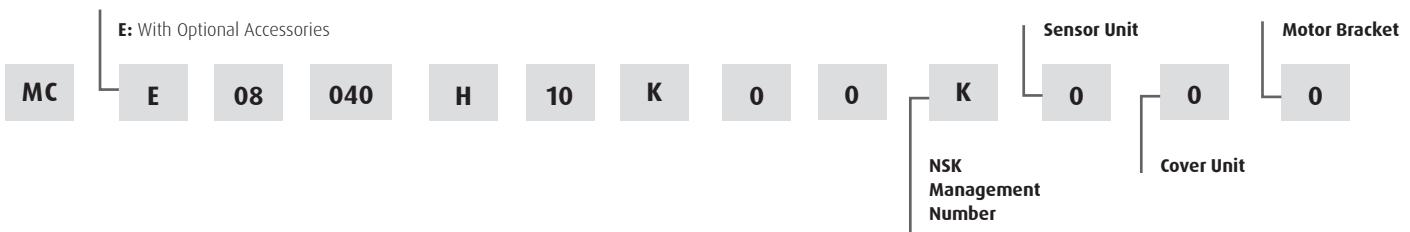

# MCM SERIES MONOCARRIER™

## MCM SERIES REFERENCE NUMBER CODING

## WITH OPTIONAL ACCESSORIES

Monocarrier™ is suitable for a vertical axis of a material handling robot.

## APPLICATIONS

- › Equipment that Needs to Reduce the Weight
- › Substitution for Pneumatic Actuator
- › Robots
- › Transporting Equipment
- › Measuring Machine
- › Equipment for Factory Automation

# ACCURACY GRADE AND LIMITATIONS OF MCM SERIES

The accuracy grade of Monocarrier™ standard inventories is high grade (H), except for lead 1 and 2 of MCM02 and MCM03. When you require strokes longer than 1,200mm, please consult NSK about the accuracy grade.

## ACCURACY GRADE

Unit:  $\mu\text{m}$

Grade	High Grade			Precision			
	Stroke (mm)	Repeatability	Running Parallelism (vertical)	Backlash	Repeatability	Positioning Accuracy	Running Parallelism (vertical)
~200	$\pm 10$	14	20 or less	$\pm 3$	20	8	3 or less
~400	$\pm 10$	16	20 or less	$\pm 3$	25	10	3 or less
~600	$\pm 10$	20	20 or less	$\pm 3$	30	12	3 or less
~700	$\pm 10$	23	20 or less	$\pm 3$	30	15	3 or less
~1,000	$\pm 10$	23	20 or less	$\pm 3$	35	15	3 or less
~1,200	$\pm 10$	30	20 or less	$\pm 3$	40	20	3 or less

## LIMITATIONS

Model No.	Lead (mm)	Slider	Stroke (mm)
MCM02	1,2	Single	150
MCM03	1,2 10,12	Single Single	150 350

	30		11,700	23,200			22,700				

Notes: • Basic dynamic and static load ratings indicate values for one slider. • Basic dynamic load rating of linear guide is load of perpendicular direction to the axis that allows 90% of a group of the same Monocarriers™ to operate "Rated running distance" in table, that is equivalent to 1 million revolutions of ball screw and support unit under the same conditions without causing flaking by rolling contact fatigue. • Basic dynamic load rating of ball screw is load in the axial direction that allows 90% of ball screws of a group of the same Monocarriers™ to rotate 1 million revolutions under the same conditions without causing flaking by rolling contact fatigue. • Basic dynamic load rating of support unit is constant load in the axial direction that allows 90% of support units of the same group of Monocarriers™ to rotate 1 million revolutions under the same conditions without causing flaking by rolling contact fatigue. • Basic static load rating is load that results in combined permanent deformations at contact points of balls and ball grooves of respective parts at a diameter of 0.01%.

## BASIC STATIC MOMENT LOAD OF LINEAR GUIDE

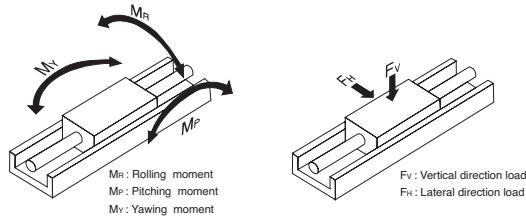

Model No.	Lead (mm)	Slider	Basic Static Moment (N·m)		
			Rolling $M_{Ro}$	Pitching $M_{Po}$	Yawing $M_{Yo}$
MCM02	1,2	Single	24	8	8
MCM03	1,2 10,12	Single	68 92	28 51	28 51
MCM05	5,10,20,30*	Single Double	229 455	89 765	89 765
MCM06	5,10,20	Single Double	415 825	174 1,220	174 1,220
MCM08	5,10,20,30*	Single Double	770 1,540	300 2,050	300 2,050
MCM10	10,20,30*	Single Double	1,170 2,340	425 2,940	425 2,940

\* Basic static moment of double slider is a value when two sliders equipped with NSK K1™ are butted against each other.

\* Basic static moment is the value when a rolling contact pressure of balls exceeds 4,000N/mm<sup>2</sup>.

\* If extremely heavy load is required, please consult NSK for estimation of fatigue life.

\* Applicable only to single slider.

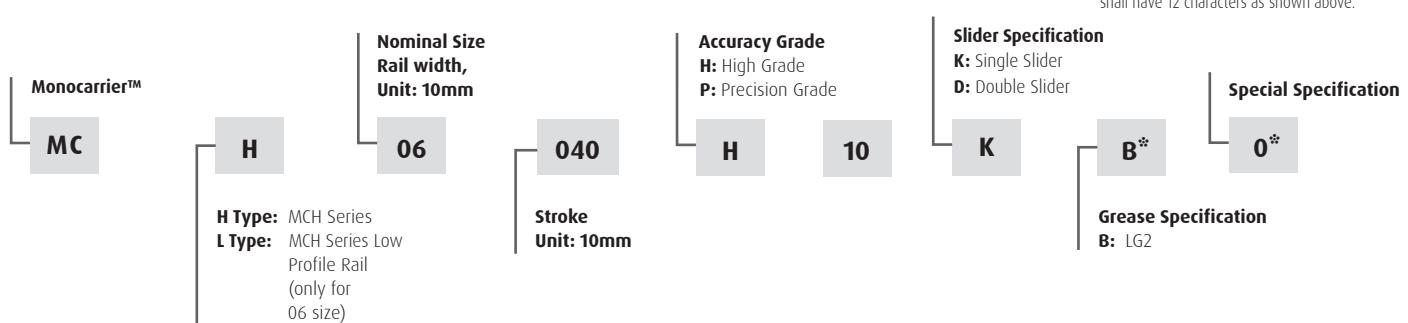

Please see NSK's Linear Actuator catalog for more detailed information on Monocarriers™.

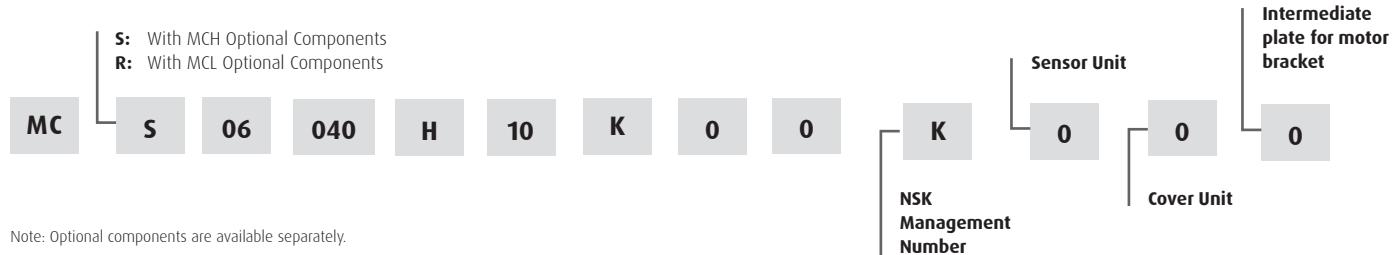

# MCH SERIES MONOCARRIER™

## MCH SERIES REFERENCE NUMBER CODING

## WITH OPTIONAL ACCESSORIES

Note: Optional components are available separately.

Monocarrier™ is stiff rail, which can be a beam on its own.

## APPLICATIONS

- › Equipment that Needs to Reduce the Weight
- › Substitution for Pneumatic Actuator
- › Robots
- › Transporting Equipment
- › Measuring Machine
- › Equipment for Factory Automation

Please see NSK's Linear Actuator catalog for more detailed information on Monocarriers™.

# ACCURACY GRADE AND LIMITATIONS OF MCH SERIES

The accuracy grade of Monocarrier™ standard inventories is high grade (H), except for lead 1 and 2 of MCM02 and MCM03. When you require strokes longer than 1,200mm, please consult NSK about the accuracy grade.

## ACCURACY GRADE

### Notes

- Basic dynamic and static load ratings indicate the values for one slider.
- Basic dynamic load rating of the linear guide is the load of perpendicular direction to the axis that allows 90% of a group of the same Monocarriers™ to operate, “Rated running distance” in the table, that is equivalent to 1 million revolutions of the ball screw and the support unit under the same condition without causing flaking by rolling contact fatigue.
- Basic dynamic load rating of the ball screw is a load-to-axial direction that allows 90% of ball screws of a group of the same Monocarriers™ to rotate 1 million revolutions under the same condition without causing flaking by rolling contact fatigue.
- Basic dynamic load rating of the support unit is a constant load-to-axial direction that allows 90% of support units of the same group of Monocarriers™ to rotate 1 million revolutions under the same condition without causing flaking by rolling contact fatigue.
- Basic static load rating is a load that results in combined permanent deformations at the contact points of balls and ball grooves of respective part, which is 0.01% of the diameter.

## BASIC STATIC MOMENT LOAD OF LINEAR GUIDE

Basic Static Moment (N·m)				
Nominal size	Slider	Rolling $M_R$	Pitching $M_P$	Yawing $M_Y$
MCH06 (MCL06)	Single	335	133	133
	Double	770	730	730
MCH09	Single	890	385	385
	Double	1,780	2,070	2,070
MCH10	Single	1,460	610	610
	Double	2,920	3,430	3,430

- Basic static moment of double slider is a value when two sliders equipped with NSK K1™ Lubrication Units are butted against each other.
- The basic static moment is the value when a rolling contact pressure of balls exceeds 4,000N/mm<sup>2</sup>.
- If operating under extreme load conditions, please consult NSK for estimation of fatigue life.

Please see NSK's Linear Actuator catalog for more detailed information on Monocarriers™.

# BEARING SELECTION

The original equipment manufacturer (OEM) will select a bearing for their equipment based on the loading requirements of, and the space available for, the bearing. The bearing style and size provide the foundation for the bearing selection based on the load carrying capacity in relation to the loads to be carried.

## SELECTION BASED ON BASIC LOAD RATING

The most common way to determine bearing life is by using the load ratings of the bearing and the loads required by the application. The common measurement is "**L<sub>10</sub>**" life, defined as the number of revolutions before metal fatigue first appears on 10% of a large group of like bearings. This is referred to as basic rating life or fatigue life. The equations for calculating **L<sub>10</sub>** life are:

$$\text{For ball bearings: } L_{10} = \left(\frac{C}{P}\right)^3$$

$$\text{For roller bearings: } L_{10} = \left(\frac{C}{P}\right)^{10/3}$$

Where

**L<sub>10</sub>**: Rating fatigue life (1 million Revs)

**P**: Bearing Equivalent Load (lbf, N, kgf), see below for calculation of **P**

**C**: Basic Load Rating (from catalog tables)

For radial bearings, **C=Cr**

For thrust bearings, **C=Ca**

If the bearings run at a constant speed, it is convenient to determine **L<sub>10h</sub>** life in terms of hours. This equation is expressed as:

$$\text{For ball bearings: } L_{10h} = \frac{1,000,000}{60n} \left(\frac{C}{P}\right)^3$$

$$\text{For roller bearings: } L_{10h} = \frac{1,000,000}{60n} \left(\frac{C}{P}\right)^{10/3}$$

Where

**L<sub>10h</sub>**: Rating fatigue life in hours

**n**: Rotational speed, RPM

## Equivalent Bearing Loads (**P**)

To determine the value of **P**, you must first determine the effects of the radial and axial loads applied. Once this hypothetical load is determined, it is assumed to be constant in magnitude and direction. The general formula for the calculation of **P** is: **P = X Fr + Y Fa**

Where

**P**: Bearing equivalent load (lbf, N, kgf)

**X**: the Radial factor

**Fr**: the Actual constant radial load

**Y**: the Axial factor

**Fa**: the Actual constant axial load

The values for **X** and **Y** can be determined using the tables J.1 - J.3. First, determine the type of bearing being considered. Then, calculate the ratio of the axial load to the radial load and compare this to the bearings "**e**" value in the table. The "**e**" value is determined by multiplying the axial load applied to the bearing by the bearing coefficient factor, **f<sub>0</sub>**, which is obtained from the bearing tables. Divide the result by the static radial load rating. Locate the result in the first column and read across to find the "**e**" value. (In the case of angular contact bearings, the "**i**" value must be used. If a duplex pair in a DB or DF configuration is used, the "**i**" value is 2.) In effect, if the axial load is small compared to the radial load, then only the radial load is considered. If not, then a combination of the two is used. After determining the equivalent bearing load, **P**, the **L<sub>10</sub>** formula given above can be used to determine the **L<sub>10</sub>** life with 90% reliability for a given bearing's basic load rating.

Also, for a required **L<sub>10</sub>** life, a basic load rating requirement can be found for bearing selection.

**Table J.1 - Equivalent Load Factors for Ball Bearings**

Dynamic Equivalent Load $P=XF_r+YF_a$						
$\frac{f_0 F_a}{C_{or}}$	e	$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$		
		X	Y	X	Y	
0.172	0.19	1	0	0.56	2.30

## CORRECTION OF BASIC LOAD RATING DUE TO TEMPERATURE

The operating temperature will significantly affect the fatigue life by altering the hardness of the bearing. Consequently, the basic load rating, which depends on the physical properties of the bearing material, will decrease with higher temperatures. Thus, the basic load rating must be corrected for higher temperatures using the equation:  $C_t = f_t * C$

Where  $C_t$ : Basic load rating after temperature correction

$f_t$ : Temperature factor (see following table)

$C$ : Basic load rating from tables, before application of temperature correction.

**Table J.4 - Temperature Factor ( $f_t$ )**

Temperature Factor $f_t$	Bearing Temperature (°C)			
	≤150°	175°	200°	250°
	1.00	0.95	0.90	0.75

## ADJUSTMENTS TO FATIGUE LIFE RATING

Each style of bearing has many characteristics that make that bearing better suited for an application than another bearing. For example, some common applications require a bearing that can handle misalignment, loads in both directions, high speeds, etc..., or a combination of two or more. These operating conditions will alter the bearing life and are accounted for by using correction factors for temperature, reliability, bearing material, and other operating conditions. For the complete list of adjustment factors and their values, please contact NSK engineering or refer to NSK catalog E1103 - (Rolling Bearings)

The formula for adjusting life based on reliability, material, and operating conditions is:

$$L_{na} = a_1 * a_2 * a_3 * L_{10}$$

Where  $L_{na}$ : Adjusted life rating.

$L_{10}$ : Life rating, adjusted for fatigue life of 90% reliability. This may not satisfy all applications. For higher reliability requirements,  $L_{10}$  must be adjusted.

$a_1$ : Life correction factor for reliability. This is determined from the reliability required of the bearing for its application (see table below).

$a_2$ : Life correction factor for bearing material.

$a_3$ : Life correction factor for operating conditions.

Values of  $a_2$  and  $a_3$  are difficult to determine, however, for most applications,  $a_2 * a_3 = 1$  can be assumed. If you have concerns about lubrication viscosity, temperature, contamination, misalignment, or other operating abnormalities, please consult NSK Engineering.

**Table J.5 - Reliability Factor ( $a_1$ )**

Reliability						
	90%	95%	96%	97%	98%	99%
$a_1$	1.00	0.62	0.53	0.44	0.33	0.21

## STATIC LOAD RATING

Some applications are stationary with loads for long periods, rotate at very low speeds, are subjected to slow oscillations, or are exposed to shock loads. In these events, the static load rating ( $C_{or}$  or  $C_{oa}$ ) must be used in the life calculations. Please contact NSK Engineering for more details.

## SELECTION BASED ON DIMENSIONS

For single row bearings having the same width series, diameter series, and bore size, all styles have the same bore, O.D., and width. For example, 6203, NJ203, and 7203 all have a 17mm bore, a 42mm O.D., and 12mm width. Therefore, selection can be made based on the requirements of the application such as, speeds, misalignment capabilities, bearing value, etc..., provided that the life requirement is met by the bearing style.

# BEARING TOLERANCES

## BEARING TOLERANCE STANDARDS

The dimensional and running accuracies of rolling bearings are standardized by ISO with regard to the following items:

- Tolerances for bore diameter, outer diameter, individual ring width, and overall width.
- Tolerances for absolute dimensions of inscribed circle diameter and circumscribed circle diameter.
- Tolerances for chamfer dimension.
- Tolerances for width variations.
- Tolerances for taper angle and taper bore diameters.
- Tolerances for radial runout of inner ring and outer rings.
- Tolerances for axial runout of inner and outer rings.
- Tolerances for side or face runout of inner ring.
- Tolerances for side or face runout of outer ring.

In grading bearing tolerances, ISO "normal class" represents the standard. ISO classes 6, 5, 4, and 2 represent four higher grades. In general, DIN, JIS, and ABMA tolerance classes conform to these ISO standards. Tolerance classes applicable to each bearing type are shown in the subsequent tables.

Note: <sup>(1)</sup> 2.5mm is included within this group.

Remarks: (1) The outside diameter low tolerances specified in this table do not apply within a distance of 1.2 times the chamfer dimension r(max) from the ring face.

(2) The cylindrical bore diameter "no-go" side tolerance limit (high) specified in this table does not necessarily apply within a distance of 1.2 times the chamfer dimension r (max) from the ring face.

(3) ABMA Std 20-1987 was amended: ABEC1 <sup>0</sup> RBEC1, ABEC3 <sup>0</sup> RBEC3, ABEC5 <sup>0</sup> RBEC5, ABEC7, AND ABEC9 are equivalent to Classes N, 6, 5, 4, and 2 respectively.

Note: <sup>(1)</sup> Tolerance for width deviation and tolerance limits for the width variation of the outer ring should be the same bearing.<sup>(2)</sup> Applicable to individual rings manufactured for combined bearings.<sup>(3)</sup> 2.5 mm is included within this group.**Table J.13 - Tolerance of Bore Diameter of Inner Ring**

Unit: µm

Bore Over	Diameter Incl.	P4		P4Y (Controlled to median value)	
		High	Low	High	Low
30	50	0	-6	-3	
50	80	0	-7	-2	-5
80	120	0	-8	-3	-6
120	150	0	-10	-3	-7

Tolerances for bearings under 30mm bore are the same as values quoted between 30 and 50 mm bore.

Class 4Y is NSK's proprietary accuracy standard, in which tolerance of a bearing bore diameter and an outer ring diameter are in a special class (controlled to medium value) and other tolerances are Class 4. Class 4Y has the same running accuracy as Class 4 but has a narrower tolerance range of bore and outer diameter than Class 4. It is suitable for universal combination bearings.

**Table J.14 - Tolerance of Outer Diameter of Outer Ring**

Unit: µm

Outer Over	Diameter Incl.	P4		P4Y (Controlled to median value)	
		High	Low	High	Low
50	80	0	-7	-2	-6
80	120	0	-8	-2	-6
120	150	0	-9	-3	-7
150	180	0	-10	-3	-7
180	200	0	-11	-4	-9
200	Under 215	0	-11	-2	-9

Tolerances for bearings under 50mm outer diameter are the same as values quoted for bearings with outer diameters between 50-80mm outer diameter.

Class 4Y is NSK's proprietary accuracy standard, in which tolerance of a bearing bore diameter and an outer ring diameter are in a special class (controlled to medium value) and other tolerances are Class 4. Class 4Y has the same running accuracy as Class 4 but has a narrower tolerance range of bore and outer diameter than Class 4. It is suitable for universal combination bearings.

Directions: The shaft tolerances are determined by adding the top number in the tolerance group to the shaft size and adding the bottom number to the shaft size. This provides the maximum shaft size and the minimum shaft size, respectively.

For example:

Shaft size = 0.4724"

Application = Electric Motor (Recommended shaft fit js6)

Shaft Tolerance (max) = 0.4724" + 0.0002" = 0.4726"

Shaft Tolerance (min) = 0.4724" - 0.0002" = 0.4722"

Directions: The housing bore tolerances are determined by adding the top number in the tolerance group to the housing bore size and adding the bottom number to the housing bore size. This provides the maximum and minimum housing bore, respectively.

For example:

Housing bore = 1.2598"  
 Application = Electric Motor (Recommended Housing fit H7)  
 Housing Bore Tolerance (max) = 1.2598" + 0.0007" = 1.2605"  
 Housing Bore Tolerance (min) = 1.2598" + 0" = 1.2598"

# BEARING FITS & INTERNAL CLEARANCE

## FIT - WHY IT'S IMPORTANT

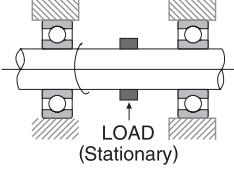

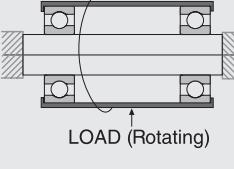

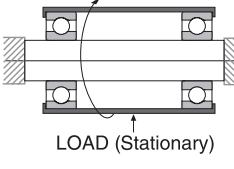

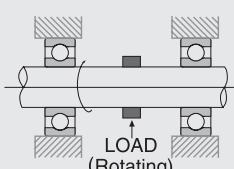

When a bearing's inner ring is fitted to the shaft with only slight interference, slipping or "creep" may occur. Creep may also occur between the outer ring and housing. In addition, abrasive metal particles resulting from creep may enter the interior of the bearing and cause abnormal heating and vibration.

When creep occurs the fitted surfaces become abraded which causes excessive wear and may cause considerable damage to the shaft or housing. In addition, abrasive metal particles resulting from creep may enter the interior of the bearing and cause abnormal heating and vibration.

It is important to prevent creep by having sufficient interference to firmly secure the bearing ring to either the shaft or housing.

In specific applications, fits can be made without interference. For example, it is usually not necessary to provide fit interference for rings subjected only to stationary loads. In other applications, loose fits may be used to accommodate certain operating conditions or to facilitate bearing mounting and dismounting. In these cases, lubrication or other methods need to be considered to prevent damage to the fitting surfaces due to creep.

**Table J.30 - Loading Conditions and Fit**

Load Application	Bearing Operation		Loading Conditions	Fit	
	Inner Ring	Outer Ring		Inner Ring and Shaft	Outer Ring and Shaft
	Rotating	Stationary	Rotating Inner Ring Load Stationary Outer Ring Load	Tight Fit	Loose Fit
	Stationary	Rotating	Rotating Inner Ring Load Stationary Outer Ring Load	Tight Fit	Loose Fit
	Stationary	Rotating	Rotating Outer Ring Load Stationary Inner Ring Load	Loose Fit	Tight Fit
	Rotating	Stationary	Rotating Outer Ring Load Stationary Inner Ring Load	Loose Fit	Tight Fit
Direction of Load Indeterminate	Rotating or Stationary	Rotating or Stationary	Direction of Load Indeterminate	Tight Fit	Tight Fit

# HOW TO SELECT A PROPER FIT

## LOAD CONDITIONS AND FIT

Proper fit may be selected from Table J.30 on page J-23 based on the load and operating conditions.

## MAGNITUDE OF LOAD AND INTERFERENCE

Under load, a slight amount of deflection or deformation of the bearing rings will occur. This reduces the interference fit. For this reason, heavier loaded bearings require a heavier initial interference fit. The required interference can be calculated using the following equations:

$$\varnothing d_f = 0.08\sqrt{\frac{d}{B}} F_r \times 10^{-3}$$

light and normal loads

$$\varnothing d_e \geq 0.02 \frac{F_r}{B} \times 10^{-3}$$

when  $F_r > .20 C_{or}$

Where  $\varnothing d_f$ : Interference decrease of inner ring (mm)

$\varnothing d_e$ : Effective interference (mm)

$d$ : Bearing bore diameter (mm)

$B$ : Inner ring width (mm)

$F_r$ : Radial load applied to bearing (N)

## INTERFERENCE VARIATION DUE TO TEMPERATURE DIFFERENCE BETWEEN BEARING AND SHAFT OR HOUSING

Interference decreases when bearing temperature increases during operation. If the temperature difference between the interior of the bearing and the surrounding parts of the housing is  $\varnothing T$  (°C), then the temperature difference between the fitted surfaces of the shaft and the inner ring is estimated to be about  $(0.1\sim 0.15)T$ . Decrease of inner ring interference due to this difference may be calculated from the following equation:

$$\varnothing d_T = (0.10 \sim 0.15) \varnothing T \cdot \alpha \cdot d = 0.0015 \varnothing T \cdot d \times 10^{-3}$$

Where  $\varnothing d_T$ : Decrease of interference of inner ring due to temperature increase (mm)

$\varnothing T$ : Temperature difference between bearing and surrounding parts

$\alpha$ : Coefficient of linear expansion of bearing steel ( $12.5 \times 10^{-6}(1/\text{°C})$ )

$d$ : Bore diameter

Table J.31 - Fits of Radial Bearings with Solid Steel Shafts

Load Conditions	Examples	Shaft Diameter (mm)			Tolerance of Shaft
		Ball Bearings	Cylindrical or Tapered Roller Bearings	Spherical Roller Bearings	
<b>Radial Bearings with Cylindrical Bores</b>					
Rotating Outer Ring Load	Easy axial displacement of inner ring on shaft desirable	Wheels on Stationary Axles	All Shaft Diameters		g6
	Easy axial displacement of outer ring on shaft unnecessary	Tension Pulleys, Rope Sheaves	All Shaft Diameters		h6
Rotating Inner Ring Load or Direction of Load Indeterminate	Light Load ( $<0.06 C_f^{(1)}$ )	Electrical Appliances, Pumps, Blowers, Transport Vehicles, Precision Machinery, Machine Tools	<18 18 to 100 100 to 200 –	– <40 40 to 140 140 to 200 –	– – – js5

Note: (1) For bearings with  $D$  greater than 304.8 mm, Class 0 does not exist.

# CHANGES IN RADIAL INTERNAL CLEARANCE

## DECREASE IN RADIAL INTERNAL CLEARANCE DUE TO FIT

When the inner or outer ring is tight-fitted to the shaft or the housing, a decrease of radial internal clearance is caused by the expansion or contraction of the bearing rings. The decrease varies according to the bearing type, bearing size and shape, and design of the shaft or housing. The amount of decrease normally ranges from 70 to 90% of the interference.

The internal clearance after mounting,  $\phi f$ , is obtained by subtracting the interference decrease from the initial internal clearance.

## TEMPERATURE EFFECTS ON RADIAL INTERNAL CLEARANCE

Under normal operation, the radial internal clearance of a bearing will decrease because of the temperature differences between the inner and outer rings. Typically, the temperatures of the inner ring and the rolling elements are higher than that of the outer ring by 8 to 15°F. When the shaft is heated or when the housing is cooled, the difference between the inner and outer rings is even larger.

The amount of decrease due to thermal expansion can be calculated from the following equations:

$$\delta t = \alpha \Delta t D_e$$

Where  $\delta t$  : Internal clearance decrease (inch) due to temperature

$\alpha$ : Coefficient of linear expansion of bearing steel ( $12.5 \times 10^{-6}$ ) ( $1/{}^\circ C$ )

$\Delta t$  : Temperature difference between inner & outer rings ( ${}^\circ C$ )

$D_e$  : Outer ring raceway diameter (inch)

$$\text{For Ball Bearings: } D_e = \frac{1}{5} (4D + d)$$

$$\text{For Roller Bearings: } D_e = \frac{1}{4} (3D + d)$$

Where  $D$  : Bearing outside diameter (inch)

$d$  : Bearing bore diameter (inch)

## EFFECTIVE CLEARANCE

The effective, or operating, clearance  $\phi$  is obtained by subtracting  $\delta t$  from the internal clearance after mounting  $\phi f$ . Theoretically, the longest life of a bearing can be expected when the effective clearance is slightly negative. However, it is difficult to achieve this condition and excessive negative clearance will shorten bearing life. Therefore, a clearance of zero or a slightly positive value is preferable.

Angular contact ball bearings or tapered roller bearings normally require the user to set the internal clearance at mounting. The user should check the proper orientation of these bearings by checking the original bearings or the service manual for the machine. A check should also be made for the recommended set clearance. This can be obtained from the service manual, the machine manufacturer, or the bearing manufacturer.

# PRELOADED BEARINGS

## TYPES AND FEATURES

Rolling bearings usually retain some internal clearance while in operation. However, in some cases it is desirable to provide a negative clearance. This is called "preloading." Preloading can be used to decrease bearing deflection and provide greater bearing rigidity. However, it may also increase power consumption and reduce bearing life.

A preload is usually given to those types of bearings in which the axial clearance can be adjusted in mounting -- for example, angular contact ball bearings and tapered roller bearings. Usually preloaded bearings are mounted face to face or back to back to form a duplex bearing set.

## WHY PRELOAD?

Typical reasons and applications for preloading bearings are:

- To maintain bearings in an exact position in both the radial and axial directions and to maintain the running accuracy of the shaft... for example, the main shaft of machine tools and instruments.
- To increase bearing rigidity. This is often needed on the main shaft of machine tools or the pinion shaft of automobile differentials.
- To minimize noise due to axial vibration and resonance...for example, in high speed or high acceleration applications of angular contact ball bearings and thrust ball bearings.
- To prevent sliding due to the gyratory movement of rolling elements...for example, in high speed or high acceleration applications of angular contact ball bearings and thrust ball bearings.
- To maintain the rolling elements in their proper position with the bearing rings...for example, on thrust ball bearings and spherical roller thrust bearings mounted on a horizontal shaft.

## HOW TO PRELOAD DUPLEX BEARINGS

There are two basic methods for preloading duplex bearings -- preloading by position and preloading by constant pressure:

### POSITION PRELOAD

Position preload is achieved by positioning two axially opposed bearings while maintaining their relative positions in operation. This is usually done by one of the following methods:

- Installing a duplex bearing set with previously adjusted stand-out dimensions and axial clearance.
- Using a spacer or shim with proper dimensions to obtain the required spacing and preload. See Figure J.1.
- Using bolts or nuts to allow adjustment of the axial clearance. In this case the starting friction torque should be measured to verify the proper preload.

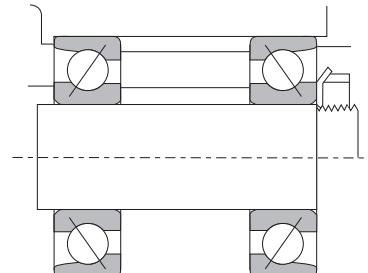

Figure J.1 - Example of Position Preload

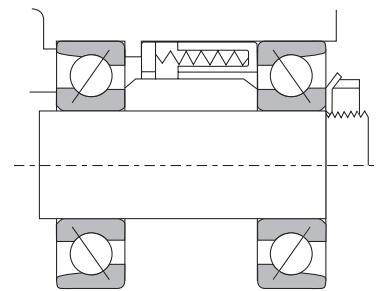

Figure J.2 - Example of Constant Pressure Preload

## CONSTANT PRESSURE PRELOAD

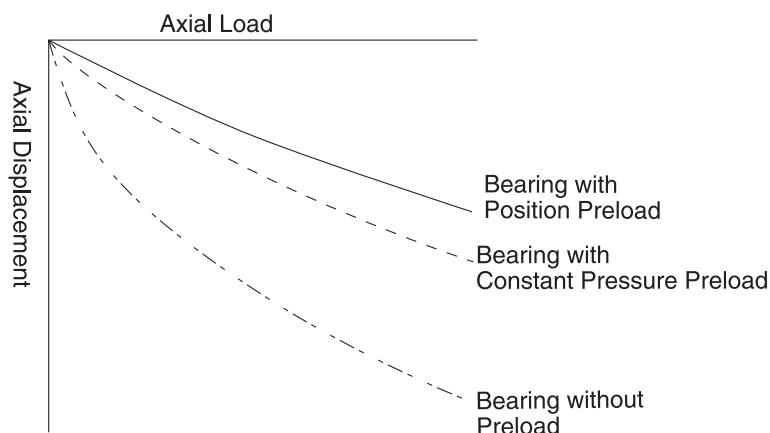

Constant pressure preload is achieved by using a coil or leaf spring to impose a constant preload. Even if the relative position of the bearings changes during operation, the magnitude of the preload remains relatively constant. See Figure J.2.

## SELECTING PRELOADING METHOD AND THE AMOUNT OF PRELOAD USE

### COMPARISON OF PRELOADING METHODS

A comparison of rigidity using different preloading methods is shown in the chart below.

**Figure J.3 - Comparison of Preloading Methods**

Position preloading is generally preferred for increasing rigidity. Constant pressure preload is more suitable for high speed applications, prevention of axial vibration, and for use with thrust bearings on horizontal shafts. Position preload and constant pressure preload each offer specific advantages:

- When equal preloads are imposed, the position preload provides greater bearing rigidity. The deflection due to external loads is less for bearings with a position preload.
- In position preloading the level of preload varies depending on such factors as a difference in axial expansion due to a temperature difference between the inner and outer rings and deflection due to load.
- In constant pressure preloading it is possible to minimize any change in the preload because the variation of the spring load with shaft expansion and contraction is negligible.

## HOW MUCH PRELOAD TO USE?

If the preload is larger than necessary, abnormal heat generation, increased frictional torque and reduced fatigue life may occur. The amount of the preload should be determined considering the operating conditions, the purpose of the preload, and the type of bearing to be preloaded.

**Preload of Duplex Angular Contact Ball Bearings** — The average preloads for duplex angular contact ball bearings (contact angle of 15°) with precision better than P5 class are listed in the tables on the following page. These bearings are used on the main shafts of machine tools.

The recommended fits between the shaft and inner ring, and between the housing and outer ring are listed in Table J.32 on page J-25 thru Table J.35 on page J-26.

For housing fits, the lower limit of the fit range should be selected for fixed-end bearings and the upper limit for free-end bearings.

As a general rule, an extra light or light preload should be selected for spindles of grinders and a medium preload should be selected for the main shafts of high speed lathes and milling machines.

## PRELOAD OF THRUST BALL BEARINGS

When the balls in thrust ball bearings rotate at relatively high speeds, sliding due to the gyratory movement of the balls may occur. The larger of the two values obtained from the equations below should be selected as the minimum axial load in order to prevent such sliding.

$$F_{a,\min} = \frac{C_{oa}}{100} \left( \frac{n}{N_{max}} \right)^2$$

Where:  $F_{a,\min}$ : Minimum axial load, N  
 $C_{oa}$ : Basic static load rating, N  
 $n$ : Rotational speed, RPM  
 $N_{max}$ : Limiting (oil lubrication), RPM

## PRELOAD OF SPHERICAL ROLLER THRUST BEARINGS

When spherical roller thrust bearings are used a preload is necessary to keep the rollers in proper position against the outer ring raceway. The minimum axial load  $F_{a,\min}$  necessary to do this is:  $F_{a,\min} = \left( \frac{C_{oa}}{1000} \right)$

# LUBRICANTS

## LUBRICATING GREASE

Grease is a semi-solid lubricant of a base oil and a thickener. Other ingredients are sometimes added to impart special properties to the base.

The main types and general properties of grease are shown in Table J.42 on page J-33. It should be noted that different brands of the same type of grease may have different properties.

**Base Oil** – Mineral oil or synthetic oils such as silicon or diester oil, are commonly used as the base oil for grease. The lubricating properties of grease are dependent on the characteristics of its base oil. The viscosity of the base oil is an important consideration when selecting grease. Usually grease made with a low viscosity base oil is more suitable for high speeds and low temperatures while grease made with high viscosity base oils is more suited for high temperatures and heavy loads. The thickener also influences the lubricating properties of grease, therefore selection criteria for grease are not the same as for lubricating oil.

**Thickener** – Several types of metallic soaps, inorganic compounds such as silica gel and bentonite, and heat resisting organic thickeners such as polyurea and flouric compounds are used as thickeners for grease. The water resistance properties of grease depend on the type of thickener. Sodium soap grease (or compound grease containing sodium soap) emulsifies when exposed to water or high humidity and therefore cannot be used where moisture is prevalent. Lithium soap grease, on the other hand, is recommended where moisture is present because of its resistance to wash off.

For applications where the operating temperature exceeds the limitation of common multi-purpose grease, greases having complex bases or non-soap bases are recommended. The grease used should also have a synthetic oil to withstand rapid deterioration at high temperatures. If the grease used in a high temperature application uses a mineral oil, it should be replenished frequently as deterioration of the oil will be accelerated at high temperatures.

**Additives** – Grease often contains a variety of additives such as antioxidants, corrosion inhibitors, and extreme pressure additives to give it special properties. Extreme pressure additives are recommended for use in heavy load applications. For long use without replenishment, an antioxidant should be added.

**Consistency** – Consistency indicates the “softness” of the grease. The following table shows the relationship between consistency and working conditions.

**Table J.41 - Lubricant Consistency**

Consistency Number (Given by the National Lubricating Grease Institute (NLGI) Scale)					
	0	1	2	3	4
Consistency (1) (1/10mm)	385~355	340~310	295~265	250~220	205~175
Working Condition	For centralized oiling. When false brinelling is liable to occur.	For centralized oiling. When fretting is liable to occur. For low temperature.	For general use. For sealed bearings.	For high temperature. For general use. For sealed bearings.	For high temperature. For grease seals.

Note: (1) Consistency: Depth into grease attained by a cone when pressed with a specified weight, indicated in units of 1/10 mm. The larger the value, the softer the grease.

**Mixing Different Types of Grease** – In general, grease of different types must not be mixed. Mixing grease with different types of thickeners may destroy the composition and physical properties of the grease. Even if the thickeners are of the same type, possible differences in the additives may cause detrimental effects.

Water Resistance	Good	Good	Good	Poor	Good	Poor for Na Soap Grease	Good	Good	Good
Rust Prevention	Good	Good	Poor	Poor to Good	Good	Fair to Good	Fair to Good	Fair to Good	Fair to Good
Remarks	General purpose lubricant.	Good low temperature and torque characteristics. Often used for small motor and instrument bearings.	Mainly for high temperature applications. Unsuitable for bearings under high speed or heavy load conditions or for sliding contact areas (roller bearings).	Long and short fiber types available. Long fiber grease is not suitable for high speeds or for sliding contact areas (roller bearings).	Not suitable for high temp. and heavy loads. Extreme pressure grease containing high viscosity oil and extreme pressure additive (Pb soap, etc.) is available.	Often used for roller bearings and large ball bearings.	Suitable for extreme pressures. Mechanically stable.	Medium and high temperature lubricant.	Recommended for special environments with very high and low temperatures, acids, alkalis, radioactivity, and exposure to flames.

Note: (1) The grease properties shown here can vary between different brands.

(2) the values listed are percentages of the limiting speeds given in the bearing tables.

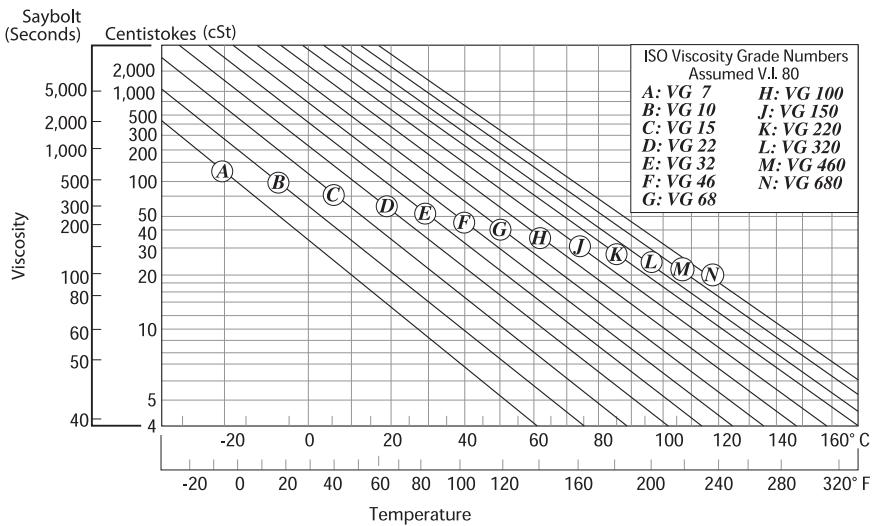

## LUBRICATING OIL

Lubricating oil used for bearings is usually a highly refined mineral or synthetic oil which has a high film strength and superior oxidation and corrosion resistance. When selecting an oil, the viscosity of the operating conditions is very important. If the viscosity is too low, a proper oil film is not formed and abnormal wear and seizure may occur. On the other hand, if the viscosity is too high, excessive viscous resistance may cause heating or a large power loss. In general, low viscosity oils should be used at high speeds. Higher viscosity oils should be used for heavy loads or for the larger bearings. The following table shows the generally recommended viscosity for certain bearing types.

**Table J.43 - Recommended Viscosity by Bearing Type**

Bearing Types	Proper Viscosity at the Operating Temperature
Ball Bearings and Cylindrical Roller Bearings	Higher than 13 cST
Tapered Roller Bearings and Spherical Roller Bearings	Higher than 20 cST
Spherical Roller Thrust Bearings	Higher than 32 cST

**Figure J.4 - Temperature - Viscosity Chart**

This chart shows the relationship between temperature and viscosity for use in selection of the proper lubricating oil.

**Oil Replacement Interval** – The oil replacement interval depends on the operating conditions and oil quantity. In those cases where the operating temperature is less than 120°F and the environmental conditions are good, oil should be replaced approximately once a year. However, where the oil temperature is about 212°F the oil must be changed at least once every three months.

In dirty environmental conditions, or if moisture or foreign material is mixed in the oil, the replacement interval must be shortened.

Mixing different brands of lubricating oil should be avoided.

# BEARING LUBRICATION

## LUBRICATION - THE PURPOSE

Lubrication is needed to reduce friction and wear inside the bearing. Proper lubrication and procedures will allow the bearing to reach its expected life.

Primarily, lubrication serves the following purposes:

- Reduces Friction and Wear – Direct metallic contact between the bearing rings, rolling elements and cage is prevented by an oil film which reduces the friction and heat at the contact areas.
- Extends Bearing Life – The rolling fatigue life of bearings depends in a large part on the viscosity and film thickness of the lubricant. A proper film thickness prolongs the bearing fatigue life.
- Cooling – Circulating oil can be used to carry heat away from the bearing. A circulating system is normally used when excessive heat is generated by the bearing due to high speeds, high loads, or when heat from a source adjacent to the bearing can affect its operation. Oils deteriorate at high temperatures; therefore it is important to keep both the oil and the bearing cool.
- Other Purposes – Proper lubrication also helps to prevent foreign material from entering the bearings, and protects against corrosion or rusting.

## SELECTING THE CORRECT LUBRICATION METHOD

Lubrication can be accomplished by using either oil or grease. The most satisfactory bearing performance will be achieved by selecting the method most suitable for a specific application. This of course will also depend on the conditions under which the bearing will operate.

Oil lubrication is superior in lubricating efficiency, however, grease lubrication allows a simpler structure around the bearings. The following table compares oil and grease lubrication.

**Table J.44 - Grease vs. Oil Lubrication**

Operating Factor	Grease Lubrication	Oil Lubrication
Housing Structure and Sealing Method	Simple	May be complex. Careful maintenance required.
Speed	Limiting speed is 65 % to 80% that of oil lubrication	High limiting speed
Cooling Effect	Poor	Heat transfer is possible using forced oil circulation lubrication
Fluidity	Poor	Good
Full Lubrication Replacement	Sometimes difficult	Easy
Removal of Foreign Matter	Removal of particles from grease is impossible	Easy
External Contamination Due to Leakage	Surroundings seldom contaminated by leakage	Often leaks without proper countermeasures. Not suitable if external contamination must be avoided.

## **GREASE LUBRICATION**

### **GREASE QUANTITY**

The quantity of grease to be packed in a housing depends on the housing design, rotational speeds of the bearings, characteristics of the grease selected, and the ambient temperature conditions. These factors are critical to satisfactory performance.

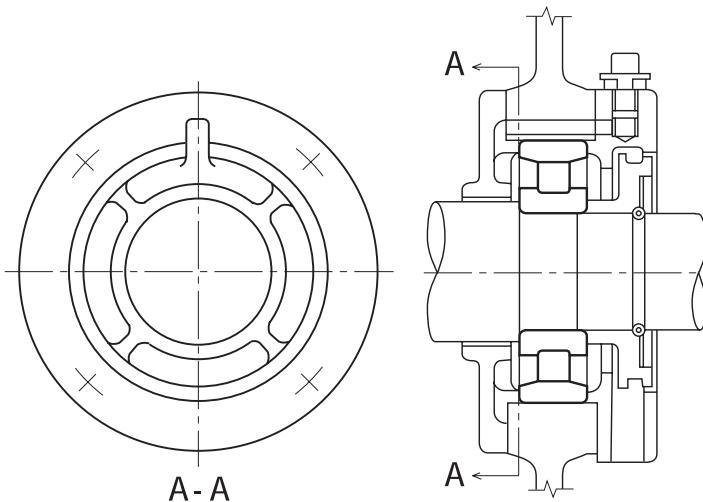

In applications where the operating speed does not exceed one-half the rated limiting speed of the bearing, the housing should be packed one-half to two-thirds full. If the speed of the bearing exceeds one-half the limiting speed, the quantity of grease should be reduced to one-third to one-half full and periodic regreasing scheduled. When operating conditions are not severe, the original pack of grease should last a long time without replenishment. If the operating conditions become severe, it will be necessary to re grease periodically.

Care should be taken to avoid excessive greasing as this will cause bearings to overheat.

### **REPLACEMENT OF GREASE**

Grease, once packed, usually need not be replenished for a long time; however, for severe operating conditions, grease should be frequently replenished or replaced. In such cases, the bearing housing should be designed to facilitate grease replenishment and replacement.

When replacement intervals are short, provide replenishment and discharge ports at appropriate positions so deteriorated grease is replaced by fresh grease. For example, the housing space on the grease supply side can be divided into several sections with partitions. The grease on the partitioned side gradually passes through the bearings and old grease forced from the bearing is discharged through a release valve. If a grease valve is not used, the space on the discharge side is made larger than the partitioned side so it can retain the old grease, which is removed periodically by removing the cover.

**Figure J.5 - Combination of Partitioned Grease Reservoir and Grease Valve**

# BEARING LUBRICATION (CONT.)

## REPLENISHMENT INTERVAL

Even if high-quality grease is used, there is deterioration of its properties with time; therefore, periodic replenishment is required. Figure J.6 shows the replenishment time intervals for various bearing types running at different speeds.

- Temperature

If the bearing temperature exceeds 70°C, the replenishment time interval must be reduced by half for every 15°C temperature rise of the bearings.

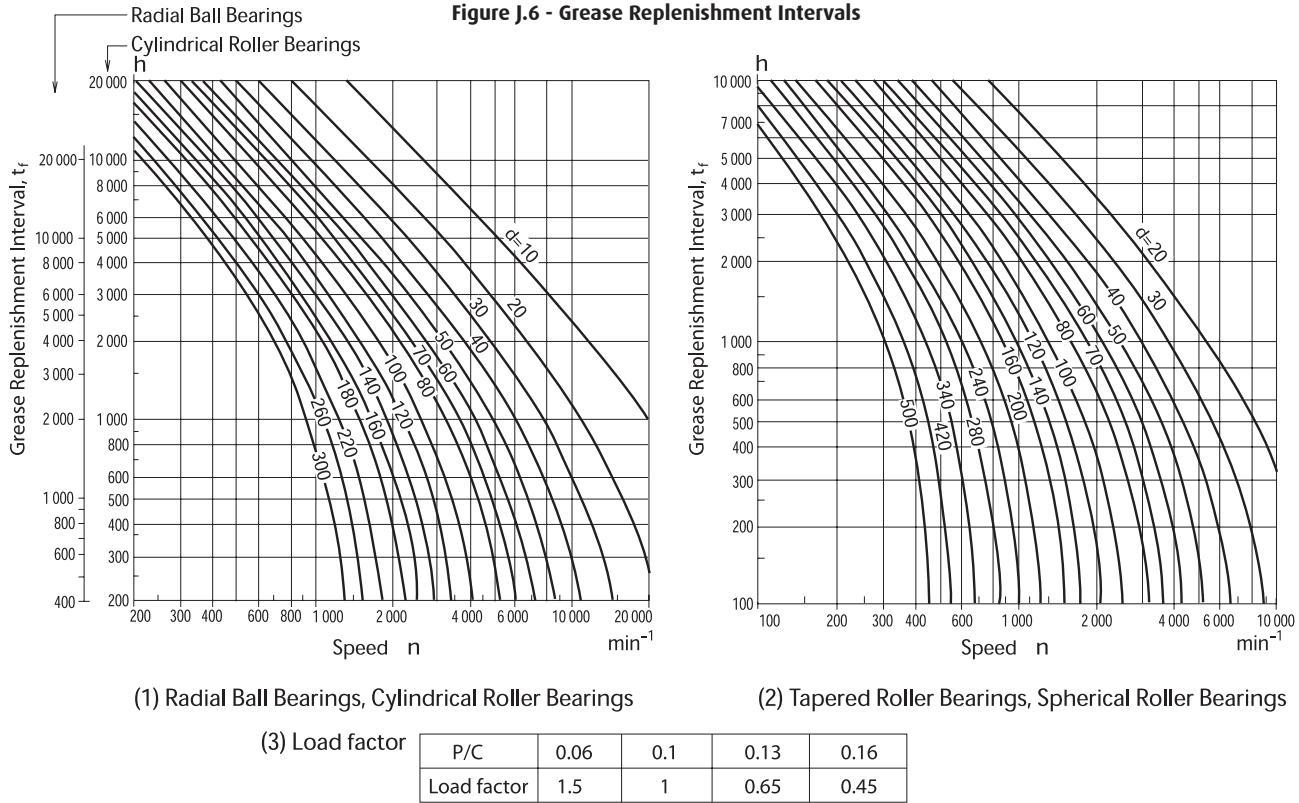

- Grease

In case of ball bearings especially, the replenishing time internal can be extended depending on used grease type. For example, high quality lithium soap-synthetic oil grease may extend about two times of replenishing time interval. If the temperature of the bearings is less than 70°C, the usage of lithium soap-mineral oil grease or lithium soap-synthetic oil grease is appropriate.

- Load

The replenishing time interval depends on the magnitude of the bearing load. If P/C exceeds 0.16, it is advisable to consult NSK.

Figure J.6 - Grease Replenishment Intervals

## GREASE REPLENISHMENT

Frequent grease replenishment is required when operating conditions are severe such as in high ambient temperatures or where contaminants can enter bearing housings. Routine regreasing schedules should be established. In cases where extremely severe conditions exist or the bearings are in a remote area, the bearing housing should be designed to make replenishment and replacement as simple as possible. Automatic grease systems are available and should be used.

For normal operating conditions, it may be necessary to re grease the bearing periodically to replace any grease which has leaked from the housing and to eliminate any deteriorated grease.

## OIL LUBRICATION

When the operating speed exceeds the grease limiting speed listed for the bearing, oil lubrication should be used. Several methods are available and are described below. The best method to use will depend on operating conditions.

**Oil Bath Lubrication** is a common method used where bearings are operating below the listed oil limiting speed. The static oil level should be set at the center of the lowest rolling element. An oil sight level gauge should be included in the system so that proper oil level can be quickly monitored.

**Drip Feed Lubrication** is often used for small bearings operated at relatively high speeds. In the illustration, a visible oiler is used. The oil drip rate is controlled by a screw valve located at the top of the oil cup.

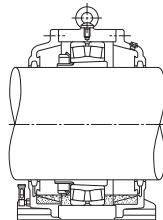

Figure J.7 - Oil Bath Lubrication

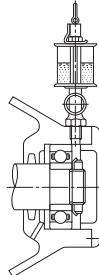

Figure J.8 - Drip Feed Lubrication

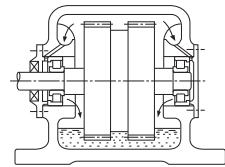

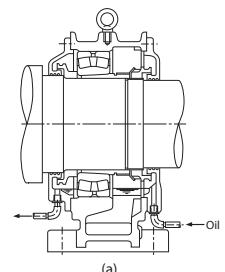

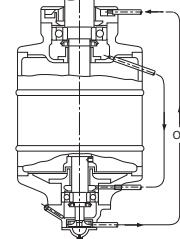

Figure J.9 - Splash Lubrication

**Splash Lubrication** - In this lubricating method, oil is splashed onto the bearings by gears or by a simple rotating disc. This method is commonly used in automobile transmissions, differentials and gear boxes. The illustration shows splash lubrication used on a reduction gear.

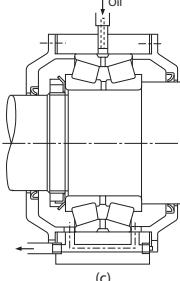

**Circulating System** lubrication is commonly used for high speed operation and for bearings used at high temperatures. As shown in the illustration, oil from the supply pipe circulates through the bearings and exits to an external reservoir. After cooling in the reservoir it returns to the bearing through a pump and filter. In a circulating system, the oil outlet should be larger in diameter than the supply pipe so that an excessive amount of oil will not remain in the housing.

(a)

(b)

(c)

Figure J.10 - Circulation Lubrication

# BEARING LUBRICATION (CONT.)

**Jet Lubrication** is often used for ultra-high speed bearings, such as the bearings in jet engines with a  $d_{mn}$  valve ( $d_m$ : pitch diameter of rolling element set in mm,  $n$ : rotational speed in min<sup>-1</sup>) exceeding one million. Lubrication oil is sprayed under pressure from one or more nozzles directly into the bearing.

Figure J.11 shows an example of ordinary jet lubrication. The lubricating oil is sprayed on the inner ring and cage guide face. In the case of high speed operation, the air surrounding the bearing rotates with it causing the oil jet to be deflected. The jetting speed of the oil from the nozzle should be more than 20% of the circumferential speed of the inner ring outer surface (which is also the guide face for the cage).

More uniform cooling and a better temperature distribution are achieved using more nozzles for a given amount of oil. It is desirable for the oil to be forcibly discharged so the agitating resistance of the lubricant can be reduced and the oil can effectively carry away the heat.

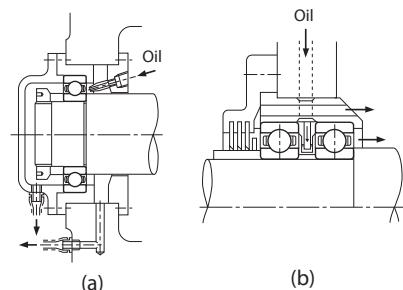

Figure J.11 - Jet Lubrication

**Oil mist lubrication**, also called oil fog lubrication, utilizes an oil mist sprayed into a bearing. This method has the following advantages:

- Because of the small quantity of oil required, the oil agitation resistance is small, and higher speeds are possible.
- Contamination of the vicinity around the bearing is slight because the oil leakage is small.
- It is relatively easy to continuously supply fresh oil; therefore, the bearing life is extended.

This lubricating method is used in bearings for the high speed spindles of machine tools, high speed pumps, roll necks of rolling mills, etc. For oil mist lubrication of large bearings, it is advisable to consult NSK.

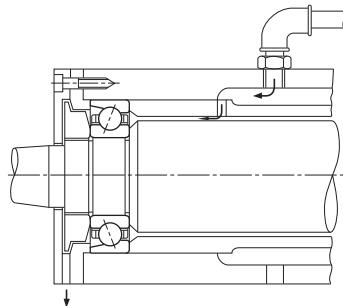

Figure J.12 - Oil Mist Lubrication

**Using the oil/air lubricating method**, a very small amount of oil is discharged intermittently by a constant-quantity piston into a pipe carrying a constant flow of compressed air. The oil flows along the wall of the pipe and approaches a constant flow rate.

The major advantages of oil/air lubrication are:

- Since the minimum necessary amount of oil is supplied, this method is suitable for high speeds because less heat is generated.
- Since the minimum necessary amount of oil is fed continuously, bearing temperature remains stable. Also, because of the small amount of oil, there is almost no atmospheric pollution.
- Since only fresh oil is fed to the bearings, oil deterioration need not be considered.
- Since compressed air is always fed to the bearings, the internal pressure is high, so dust, cutting fluid, etc. cannot enter.

For these reasons, this method is used in the main spindles of machine tools and other high-speed applications.

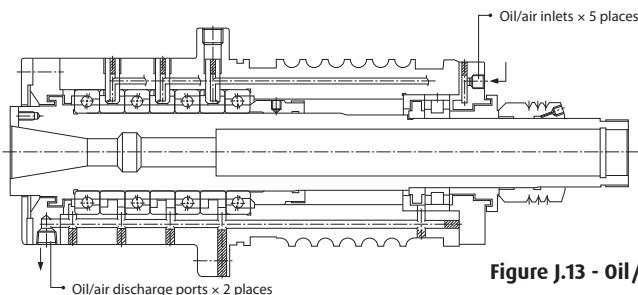

Figure J.13 - Oil/Air Lubrication

## GREASE LIFE OF SEALED BALL BEARINGS

When grease is packed into single-row deep groove ball bearings, the grease life may be estimated using the equation below or Figure J.14.

### **General purpose grease <sup>(1)</sup>**

$$\log t = 6.54 - 2.6 \frac{n}{N_{\max}} - (0.025 - 0.012 \frac{n}{N_{\max}}) / T$$

**Where:** **t:** Average grease life (h)

**n:** Speed ( $\text{min}^{-1}$ )

**N<sub>max</sub>:** Limiting speed with grease lubrication ( $\text{min}^{-1}$ )  
(values for ZZ and VV types listed in the bearing tables)

**T:** Operating temperature  $^{\circ}\text{C}$

Equations above and Figure J.14 apply under the following conditions:

(a) Speed, n

$$0.25 \leq \frac{n}{N_{\max}} \leq 1$$

When  $\frac{n}{N_{\max}} < 0.25$ , assume  $\frac{n}{N_{\max}} = 0.25$

(b) Operating Temperature, T

For general purpose grease <sup>(1)</sup>

$$70^{\circ}\text{C} \leq T \leq 110^{\circ}\text{C}$$

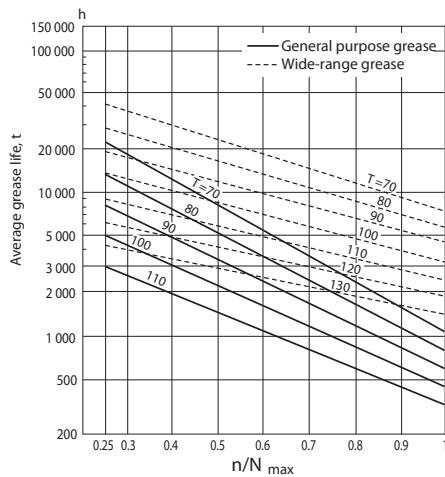

When  $T < 70^{\circ}\text{C}$  assume  $T = 70^{\circ}\text{C}$

(c) Bearing Loads The bearing loads should be about 1/10 or less of the basic load rating  $C_r$ .

### **Notes:**

(1) Mineral-oil base greases (e.g. lithium soap base grease) which are often used over a temperature range of around  $-10$  to  $110^{\circ}\text{C}$ .

(2) Synthetic-oil base greases are usable over a wide temperature range of around  $-40$  to  $130^{\circ}\text{C}$ .

**Figure J.14 - Grease Life of Sealed Ball Bearings**

# BEARING LUBRICATION (CONT.)

## OIL REPLACEMENT INTERVALS

Oil replacement intervals depend on the operating conditions and oil quality.

In those cases where the operating temperature is less than 50°C, and the environmental conditions are good with little dust, the oil should be replaced approximately once a year. However, in cases where the oil temperature is about 100°C, the oil must be changed at least once every three months.

If moisture may enter or if foreign matter may be mixed in the oil, then the oil replacement interval must be shortened.

Mixing different brands of oil must be prevented for the same reason given previously for grease.

**Table J.45 - Examples of Selecting Lubricating Oils**

Operating Temperature	Speed	Light or Normal Load	Heavy or Shock Load
-30 to 0°C	Less than limiting speed	ISO VG 15, 22, 32 (refrigerating machine oil)	--
	Less than 50% of limiting speed	ISO VG 32, 46, 68 (bearing oil, turbine oil)	ISO VG 46, 68, 100 (bearing oil, turbine oil)
	50 to 100% of limiting speed	ISO VG 15, 22, 32 (bearing oil, turbine oil)	ISO VG 22, 32, 46 (bearing oil, turbine oil)
	More than limiting speed	ISO VG 10, 15, 22 (bearing oil)	--
50 to 80°C	Less than 50% of limiting speed	ISO VG 100, 150, 220 (bearing oil)	ISO VG 150, 220, 320 (bearing oil)
	50 to 100% of limiting speed	ISO VG 46, 68, 100 (bearing oil, turbine oil)	ISO VG 68, 100, 150 (bearing oil, turbine oil)
	More than limiting speed	ISO VG 32, 46, 68 (bearing oil, turbine oil)	--
80 to 100°C	Less than 50% of limiting speed	ISO VG 320, 460 (bearing oil)	ISO VG 460, 680 (bearing oil, gear oil)
	50 to 100% of limiting speed	ISO VG 150, 220 (bearing oil)	ISO VG 220, 320 (bearing oil)
	More than limiting speed	ISO VG 68, 100 (bearing oil, turbine oil)	--

Remarks: 1. For the limiting speed, use the values listed in the bearing tables.

2. Refer to Refrigerating Machine Oils (JIS K 2211), Bearing Oils (JIS K 2239), Turbine Oils (JIS K 2213), and Gear Oils (JIS K 2219).

3. If the operating temperature is near the high end of the temperature range listed in the left column, select a high viscosity oil.

4. If the operating temperature is lower than -30°C or higher than 110°C, it is advisable to consult NSK.

# HOW TO HANDLE BEARINGS AND MOUNTING - FACTORS TO CONSIDER

## HOW TO HANDLE BEARINGS

Rolling bearings are high precision machine parts and need to be handled carefully. When installing or removing a bearing, correct procedures should be followed. Careless handling during mounting and removal could result in a serious accident, injuring people and damaging property.

Whether installing, removing, mounting, dismounting, replacing or inspecting, a few simple precautions must be followed:

### **Keep Bearings and Surroundings Clean!**

Dust and dirt, even if invisible to the naked eye, can harm bearings. To prevent the entry of dust and dirt, keep bearings and their environment as clean as possible. Never remove a bearing from its package until you are ready to mount it.

### **Handle With Care!**

Heavy shocks during handling may cause bearings to be scratched or otherwise damaged. Excessively strong impacts when mounting, dismounting or handling may cause brinelling, breaking or cracking.

### **Use Proper Tools!**

Always use the proper equipment and tools to install or remove bearings. Avoid using general purpose tools such as hammers, screwdrivers, wrenches and pliers.

### **Protect Bearings From Corrosion!**

Keep hands clean when handling bearings. Perspiration and other contaminants on the hands can cause corrosion on the bearings. Wear gloves, if possible. Apply oil or grease to non-sealed bearings immediately after installation for further protection.

## MOUNTING - FACTORS TO CONSIDER

Bearings are very precise and their mounting requires careful attention. The following items must be considered:

- Cleaning related parts
- Dimensions and finish of related parts
- Mounting procedures
- Inspection after mounting
- Supply of lubricants

Prelubricated bearings and bearings lubricated with ordinary oil or grease should not be washed before installation. The preservative used on the bearing to protect it during storage is compatible with most common lubricants.

Bearings used for instruments or high speed applications, such as machine tool bearings, can be washed before installation to remove the anti-corrosion agent used in manufacturing. These bearings must be washed in clean, filtered oil and protected from corrosion until they are installed and lubricated. However with NSK's new packaging this is not always necessary. Consult NSK if you have questions.

Bearing mounting methods depend on bearing type and the type of fit. As bearings are usually used with rotating shafts, the inner rings require a tight fit. Bearings with cylindrical bores are usually mounted by pressing through the inner ring on the shafts (press fit) or heating them to expand their diameter (shrink fit). Bearings with tapered bores can be mounted directly on tapered shafts or on cylindrical shafts by using tapered sleeves.

Bearings are usually mounted in housings with a loose fit. However, if the outer ring has an interference fit, a press may be used. Bearings can be interference fitted by cooling before mounting, using dry ice. If this is done, a rust preventive treatment must be applied to the bearings because moisture in the air will condense on bearing surfaces.

# MOUNTING - FACTORS TO CONSIDER (CONT.)

## MOUNTING BEARINGS WITH CYLINDRICAL BORES

### Before Fitting Bearings:

- Leave preservative oil on bearing
- Compatible with most oils and greases
- Provides complete protection until run
- Only remove preservative oil when bearing is to be used with special oils or greases

**Press Fits** - Fitting with a press is widely used for small bearings. Before mounting, oil should be applied to the fitted shaft surface to make insertion smoother. A mounting tool is placed on the inner ring as shown in Figure J.15. The mounting tool must not be placed on the outer ring for press mounting, because this may damage the bearing. The bearing is slowly pressed onto the shaft until the side of the inner ring rests against the shoulder of the shaft.

Using a hammer for mounting should only be done if pressing equipment is not available. Any time a hammer is used, a mounting tool must be placed on the inner ring. For tight interference fits or for medium and large bearings, a hammer should never be used.

When both the inner and outer rings of non-separable bearings, such as deep groove ball bearings, require a tight fit, a mounting tool should be placed on both rings and both rings fitted at the same time using a screw or hydraulic press. See Figure J.16.

When mounting separable bearings, such as cylindrical roller bearings and tapered roller bearings, the inner and outer rings may be mounted separately.

**Shrink Fits** - Shrink fitting is often used to avoid the large force involved in press fitting large bearings. This method eliminates the need to impose excessive force on the bearings. For shrink fitting, the bearings are first heated in oil, or in an induction heater, to expand them, then mounted and allowed to cool.

This amount of expansion of the inner ring for various temperature differences and bearing sizes are shown in Figure J.17.

A few precautions to be considered when making shrink fits:

- Do not heat bearings to more than 248°F.
- Put bearings on a wire netting or suspend them in the oil tank to prevent them from touching the tank bottom.
- Heat bearings to a temperature 36°F to 54°F higher than the lowest temperature required for mounting, because the inner ring will cool a little during mounting.

After mounting, the bearings will shrink in the axial direction as well as the radial direction while cooling. Therefore, while mounting, press the bearing firmly against the shaft shoulder to avoid excessive clearance between the bearing and the shoulder.

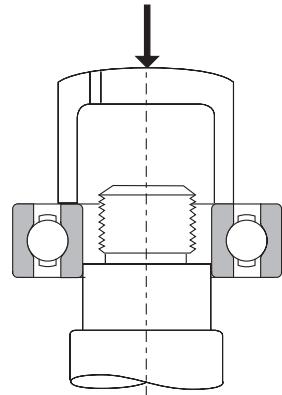

Figure J.15 - Press Mounting of Inner Ring

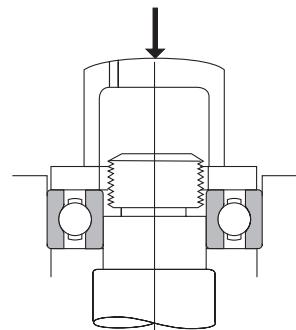

Figure J.16 - Simultaneous Press Mounting of Inner & Outer Ring

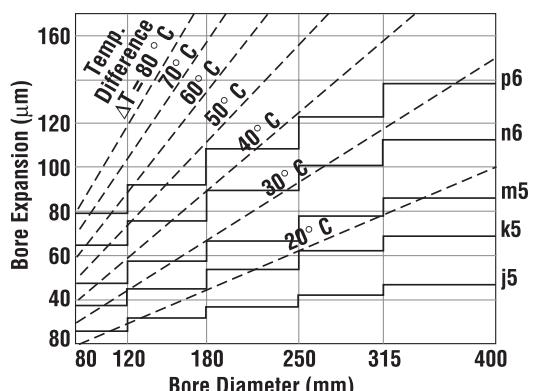

Figure J.17 - Temperature & Expansion of Inner Ring

## MOUNTING BEARINGS WITH TAPERED BORES

Bearings with tapered bores can be mounted on tapered shafts directly or on cylindrical shafts by using tapered adapters or withdrawal sleeves.

Large spherical bearings are often mounted using hydraulic pressure. Figure J.18 shows two different hydraulic mounting methods. One method is a sleeve with a hydraulic nut. The other method uses a sleeve with pressurized oil. Holes drilled in the sleeve are used to feed oil under pressure to the bearing seat. As the bearing expands radially, the sleeve is inserted axially with adjusting bolts.

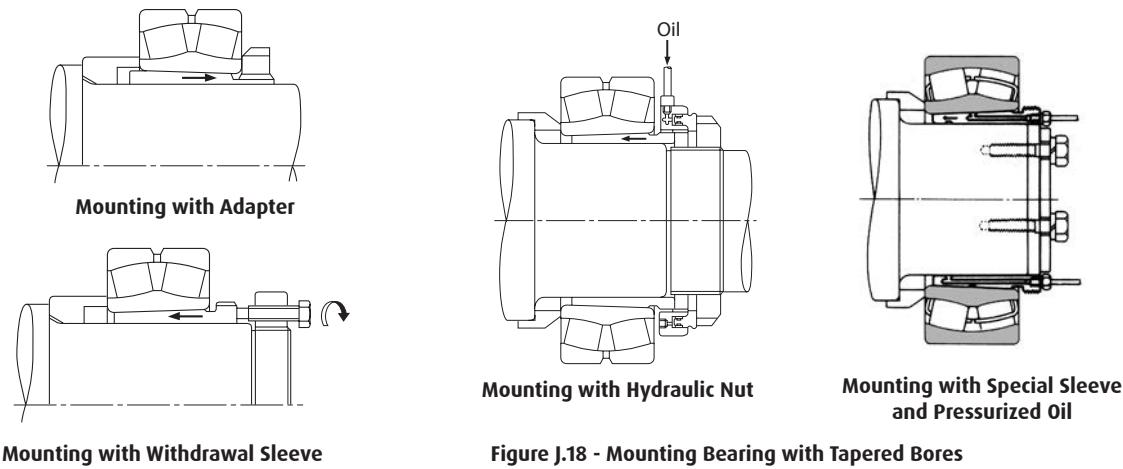

Figure J.18 - Mounting Bearing with Tapered Bores

The internal clearance of a tapered bore bearing varies with the tightness of the interference fit. It is necessary to check the clearance often as the bearing is being mounted. The bearing should be pressed until the reduction of radial clearance is within the range shown in Table J.46 on page J-45.

# MOUNTING - FACTORS TO CONSIDER (CONT.)

**Table J.46 - Reduction of Radial Clearance for Spherical Roller Bearings with Tapered Bores**

\*Axial displacement values apply only to solid steel shafts or hollow steel shafts where the bore is equal to or less than one-half of the outside diameter. If the material is other than steel, or if thin wall journals are used, please consult NSK.

1:12 Taper applies to Series 213, 222, 223, 230, 231, 232, 233, 238 and 239.

1:30 Taper applies to Series 240, 241 and 242.

For Pe less than 0.13Cr, use the lower half of the reduction range. For heavier loads or Pe greater than 0.13Cr, carburized or TL inner rings should be specified and the upper half of the reduction range can be used.

Radial internal clearance can be measured during mounting using a feeler gauge or other appropriate gauges. In this process, the clearances for both rows of rollers must be measured simultaneously and the two values kept roughly the same by adjusting the relative position of the outer and inner rings. This is shown in Fig. J.19. The average of the two measurements taken for both rows may be used as the residual internal clearance.

In large bearings (over 200mm), the outer ring may deform slightly into an elliptical shape due to its own weight. In this case, for best results, measurements should be taken at locations **a**, **b**, and **c** (see Fig. J.20) and entered into the following equation:

$$\text{radial clearance} = (a + b + c)/2$$

This method is used where the bearing is supported by its inner ring (radial clearance **c** at bottom). When a self-aligning ball bearing is mounted on a shaft adapter, sufficient clearance for easy alignment of the outer ring must be allowed.

For Radial Clearance Reduction example, please see page D-4.

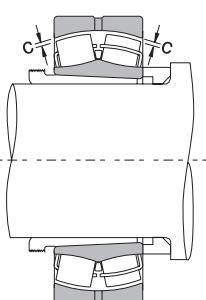

Figure J.19

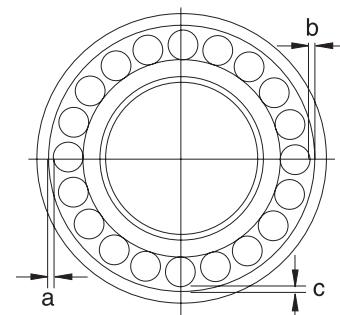

Figure J.20

## MOUNTING OF SELF-ALIGNING BALL BEARINGS ON AN ADAPTER SLEEVE

### Axial Drive-Up Method

1. Before mounting, smear the thread and the side face of the nut with a molybdenum disulphide paste or similar lubricant.
2. Smear the shaft and outside diameter of sleeve with a light oil.
3. Open the sleeve slightly by inserting and twisting a screw driver into the slit in the sleeve and position the sleeve on the shaft.
4. Slide bearing, lockwasher and locknut onto sleeve and tighten nut with a 'C' spanner until all slackness is removed.
5. Measure distance from end tapered sleeve to the face of locknut or to the face of the inner ring and note the dimension.
6. From the chart note the required "axial drive up" and tighten the locknut until the bearing has moved the required distance up the taper of the sleeve indicated by the reduction or increase in the measured distance originally noted.
7. A self-aligning ball bearing with normal clearance when adjusted correctly should rotate freely but should have some resistance to swiveling.
8. Align one tab on the lock washer with a slot in the locknut and bend it into the slot, if no tabs line up with the slots slightly tighten the locknut until one lines up. Never back off the nut to line up the tab with the slot.

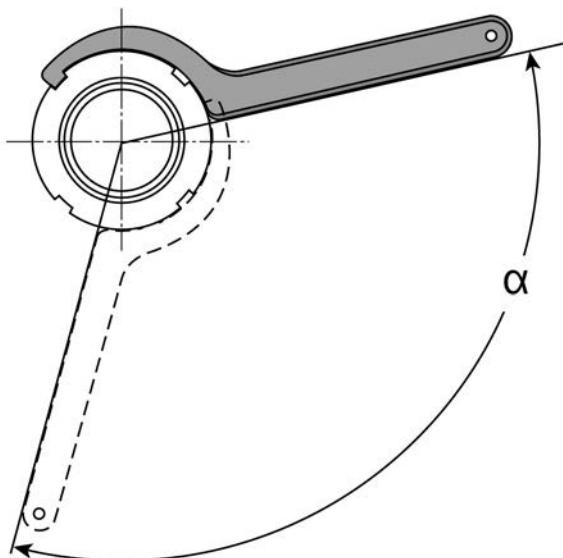

Figure J.21 - Mounting a Self-Aligning Ball Bearing on an Adapter Sleeve

## MOUNTING OF SELF-ALIGNING BALL BEARINGS ON AN ADAPTER SLEEVE

### Tightening Angle Method

1. Before mounting, smear the thread and the side face of the nut with a molybdenum disulphide paste or similar lubricant.
2. Smear the shaft and outside diameter of sleeve with a light oil.
3. Open the sleeve slightly by inserting and twisting a screw driver into the slit in the sleeve and position the sleeve on the shaft.
4. Slide bearing, lockwasher and locknut onto sleeve and tighten nut with a 'C' spanner until all slackness is removed.
5. Tighten locknut through the required angle, taken from chart, and then reposition the 'C' spanner to 180° from its original position and give it a sharp tap with the hammer to straighten the bearing on its seating.
6. A self-aligning ball bearing with normal clearance when adjusted correctly should rotate freely but should have some resistance to swiveling.
7. Align one tab on the lock washer with a slot in the locknut and bend it into the slot, if no tabs line up with the slots, slightly tighten the locknut until one lines up. **Never back off the nut to line up the tab with the slot.**

## MOUNTING - FACTORS TO CONSIDER (CONT.)

# INSPECTING AND TROUBLESHOOTING

After mounting has been completed, a running test should be conducted to determine that the bearing has been mounted properly.

Small machines may be manually operated to assure that they rotate smoothly. Items to be checked include sticking due to foreign matter, visible flaws, uneven torque, and excessive torque caused by inadequate clearance, mounting error or seal friction.

Large machines which cannot be operated manually, may be started with no load, then the power immediately cut off to allow the machine to coast to a stop. There should be no abnormal vibration, noise or contact between rotating parts. Normal powered operation may be started after this examination. Powered operation should be started slowly, without load, and the operation should be observed until it is determined that no abnormalities exist. Items to be checked during the test operation include abnormal noise, excessive rise of bearing temperature, leakage and discoloration of lubricants. Abnormal noise conditions are indicated by a loud metallic sound or other irregular noise. Possible causes of noise may include incorrect lubrication, poor alignment of the shaft and housing, and foreign matter in the bearing.

Bearing temperature may generally be estimated by the temperature of the outside surface of the housing, but it is more desirable to directly measure the temperature of the outer ring using oil holes for access. Bearing temperature should rise gradually to the steady state level within one to two hours after operation. If the bearing or mountings are improper, bearing temperature may increase rapidly and become abnormally high. Possible causes may include an excessive amount of lubricant, insufficient clearance, incorrect mounting, or excessive friction of the seals. In the case of high speed operation, an incorrect selection of bearing type or lubricating method may also cause an abnormal temperature rise.

Possible causes and countermeasures for operating irregularities are shown in the table below.

**Table J.48 - Causes and Countermeasures for Operating Irregularities**

Irregularities		Possible Causes	Countermeasures
Noise	Loud Metallic Sound	Abnormal Load	Correction of fit, internal clearance, preload, position of housing shoulder, etc.
		Incorrect mounting	Correction of alignment of shaft and housing, accuracy of mounting method
		Insufficient or improper lubricant	Replenish lubricant or select proper lubricant
		Squeaking noise	Replacement by low-noise bearings, selection of small clearance bearings
		Sliding of balls	Adjustment of preload, selection of small clearance bearings, or adoption of softer grease
	Contact of rotating parts		Correction of labyrinth seal, etc.
Abnormal Temperature Rise	Loud Regular Sound	Flaws, corrosion, or scratches on the raceways	Replacement of bearing, cleaning, improvement of seals, and usage of clean lubricant
		Brinelling	Replacement of bearing and careful handling
		Flaking on the raceways	Replacement of bearing
	Irregular Sound	Excessive clearance	Correction of fit and clearance and correction of preload
		Penetration by foreign particles	Replacement of bearing, cleaning, improvement of seals, and relubrication using clean lubricant
		Flaws or flaking on the ball surfaces	Replacement of bearing
Vibration	Excessive amount of lubricant		
	Insufficient or improper lubricant		
	Abnormal load		
	Incorrect mounting		
Leakage or Discoloration of Lubricant	Creep of fitted surfaces, excessive seal friction		
	Brinelling		
	Flaking		
	Incorrect mounting		
Penetration by foreign particles		Correction of squareness between shaft and housing shoulder or side of spacer	
Too much lubrication		Replacement of bearing, cleaning, correction of seals	
Penetration by foreign particles or abrasion chips		Reduce amount of lubricant, select stiffer grease. Replace bearing or lubricant	
		Clean housing and adjacent parts	

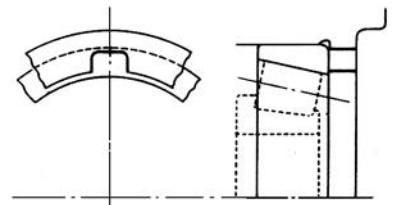

# HOW TO DISMOUNT BEARINGS

It may be necessary to remove bearings for periodic inspection or for other reasons. If the removed bearing is to be used again, it should be dismounted as carefully as when it was mounted. If the bearing has a tight fit, removal may be difficult. Dismounting procedures and the sequence of removal should be studied carefully before beginning the job.

## DISMOUNTING OF OUTER RINGS

Housings are not normally supplied with facilities to allow easy bearing removal. However, if it is necessary to periodically remove the bearing for inspection or replacement, special features can be incorporated to ease removal. One method is to provide tapped holes, in a minimum of three places equally spaced as illustrated in Figure J.22. Larger bearings will require more holes. By placing bolts in the holes and tightening evenly, the bearing will be forced out of the housing.

Another method is to provide slots in the housing shoulder as shown here. This allows the use of a press to allow safe removal of the bearing.

## DISMOUNTING OF BEARINGS WITH CYLINDRICAL BORES

If the mounting design allows space to press out the inner ring, this is an easy and fast method. In this method, the withdrawal force should be imposed only on the inner ring. When it is not possible to use a press, bearing pullers like those shown in Figure J.22 are often used. The claws of these tools must fully engage the face of the inner ring, therefore it may be necessary to cut grooves in the shoulder to accommodate the tools.

The oil injection method is usually used for the withdrawal of large bearings. Withdrawal is achieved easily by means of oil pressure applied through holes in the shaft. In the case of extra wide bearings, the oil injection method is often used along with bearing pullers.

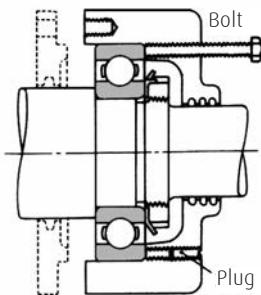

Induction heating is used to remove the inner rings of rollneck type, four row cylindrical roller bearings. The inner rings are expanded by brief local heating and then withdrawn.

## DISMOUNTING OF BEARINGS WITH TAPERED BORES

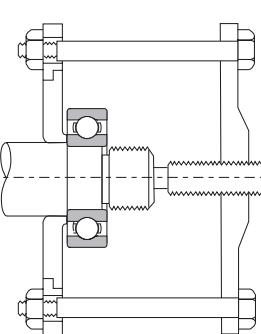

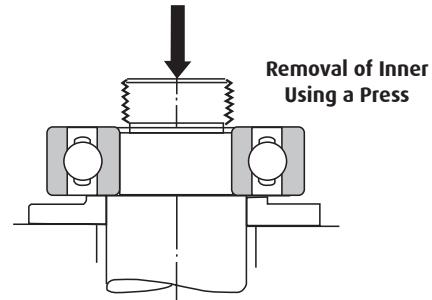

When dismounting relatively small bearings with adapter sleeves, the inner ring is held by a backing ring fastened to the shaft and the nut is loosened several turns. This is followed by hammering on the sleeve using a suitable tool. See Figure J.22. It may be possible to dismount a withdrawal sleeve by tightening the removal nut. If this procedure is difficult, it may be possible to drill and tap bolt holes in the nut and withdraw the sleeve by tightening the bolts. The two methods for removal of the sleeve are illustrated in Figure J.22.

Large bearings with tapered bores may be withdrawn easily using oil pressure. Figure J.22. illustrates the removal of a bearing by forcing oil under pressure through a hole and groove in a tapered shaft to expand the inner ring. When this method is used, the bearing may suddenly move axially when interference is relieved, so a stop nut is recommended for protection. Figure J.22. also shows a withdrawal using a hydraulic nut.

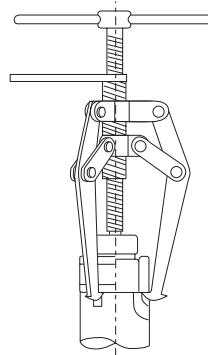

**Figure J.22 - Bearing Removal**

**Removal of Inner Ring Using an Induction Heater**

**Removal Using Oil Injection**

**Removal of Adapter with Stop and Axial Pressure**

**Removal Using a Hydraulic Nut**

# CLEANING, INSPECTION, EVALUATION, AND MAINTENANCE

## CLEANING, INSPECTION AND EVALUATION

### **Cleaning Bearings**

When bearings are inspected, their appearance should first be recorded and the amount and condition of the residual lubricant checked. After the lubricant has been sampled for examination, the bearing should be cleaned. In general, light oil or kerosene may be used as a washing solution. Dismounted bearings should first be given a preliminary cleaning followed by a finishing rinse. Each cleaning tank should be provided with a metal net to suspend the bearings in the oil without touching either the sides or bottom of the tank.

If the bearings are rotated with foreign matter in them during cleaning, the raceways may be damaged. The lubricant and other deposits should be removed in the oil bath during the initial rough cleaning with a brush or other means. After the bearing is relatively clean, it should be given a finishing rinse. The bearing should be rotated while immersed in the rinsing oil. The rinsing oil must always be kept clean.

### **Inspection and Evaluation**

After being thoroughly cleaned, bearings should be examined for the condition of their raceways and external surfaces, the amount of cage wear, the increase in internal clearance and degradation of tolerances. These must be carefully checked to determine the possibility of bearing reuse.

In the case of small non-separable ball bearings, hold the bearing horizontally in one hand and rotate the outer ring to confirm that it turns smoothly. Separable bearings such as tapered roller bearings, may be checked by individually examining their rolling elements and the outer ring raceway. Large bearings cannot be rotated manually. However, the rolling elements, raceway surfaces, cages and contact surface of the ribs should be carefully examined visually.

The determination to reuse a bearing should be made only after considering the degree of bearing wear, the function of the machine, the importance of the bearing in the machine, operating condition, and the time until next inspection. If any of the following defects exist, the bearing should be replaced:

- Cracks or dents in the inner or outer ring raceways, rolling elements or cage
- Flaking of the raceways or rolling elements
- Significant scratching of the raceway surfaces, ribs or rolling elements
- Worn cages or loose rivets
- Rust or flaws on the raceway surfaces or rolling elements
- Significant impact or brinell traces on the raceway surfaces or rolling elements
- Discoloration by heat
- Significant damage to the seals or shields of grease sealed bearings

## MAINTENANCE AND INSPECTION

### **Correcting Irregularities**

In order to maintain the original performance of a bearing for as long as possible, proper maintenance and inspection should be performed. If proper procedures are used, many bearing problems can be avoided. Periodic maintenance following specified procedures is mandatory. This includes supervision of operating conditions, supply or replacement of lubricants, and regular periodic inspection.

Items that should be regularly checked during operation include bearing noise, vibration, temperature and lubrication. If an irregularity is found during operation, the cause should be determined and the proper corrective action taken immediately. If necessary, the bearing should be dismounted and examined in detail. Refer to Table J.48 on page J-48 for causes and corrections of operating irregularities.

It is very important to detect signs of irregularities early in operation. The NSK Bearing Monitor is a device that checks the condition of bearings and gives a warning of any abnormality. It can also be used to stop the machine automatically in order to prevent serious damage. It also helps to improve the level of and attention to maintenance schedules and procedures. Contact NSK for further information.

# BEARING FAILURES

## BEARING FAILURES – CAUSE AND CORRECTION

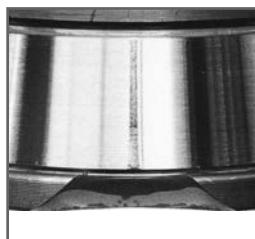

In general, if rolling bearings are correctly used, they will survive to their predicted fatigue life. Premature failure is usually caused by improperly mounting or dismounting, improper lubrication, penetration of foreign material, or inadequate inspection and maintenance.

It is often difficult to determine the real causes of premature failure. If all the conditions leading up to the time of failure are studied, it may be possible to avoid or reduce similar failures in the future.

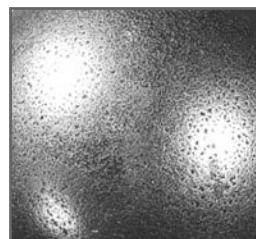

The most frequent types of bearing failure, along with causes and corrective actions, are shown in Table J.49 on page J-53.

Flaking

Fracture

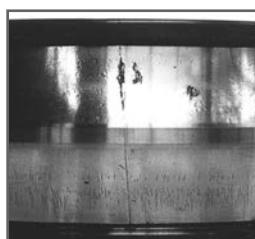

Pitting

Creep

Peeling

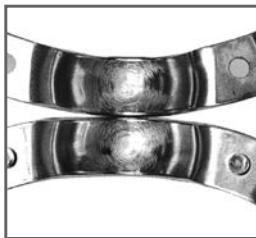

Cracks

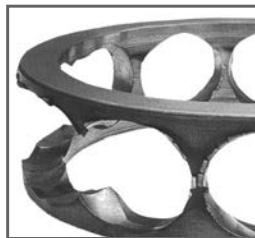

Fretting

Seizure

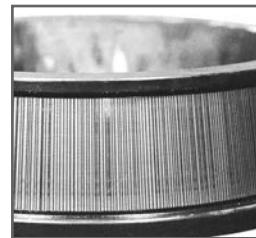

Scoring

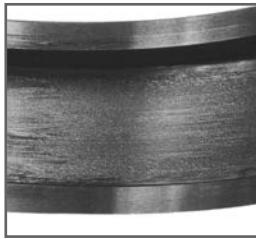

Cage Damage

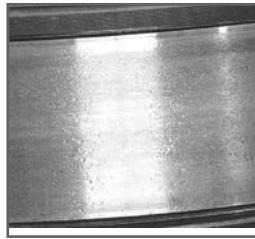

Wear

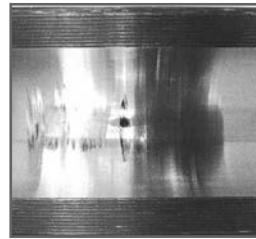

Electrical Corrosion

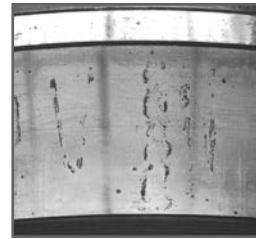

Smearing

Denting

False Brinelling

Rust and Corrosion

# BEARING FAILURES (CONT.)

**Table J.49 - Bearing Failures - Cause and Correction**

	Type of Failure	Probable Cause	Countermeasures
Flaking	Flaking of one-side of the raceway of radial bearings. Flaking of the raceways of double row bearings	Abnormal axial load	A loose fit should be used when mounting the outer ring of free-end bearings to allow axial expansion of the shaft
	Flaking of the raceway in a symmetrical pattern	Out of roundness of the housing bore	Correct the faulty housing
	Flaking pattern inclined relative to the raceway in radial ball bearings. Flaking near the edge of the raceway and rolling surfaces in roller bearings	Improper mounting, deflection of shaft, inadequate centering, inadequate tolerances for shaft and housing	Use care in mounting and centering, select a bearing with a larger clearance, and correct the squareness of the shaft and housing shoulder
	Flaking of raceway with same spacing as rolling elements	Large shock load during mounting, rusting while bearing is out of operation for a prolonged period	Use care in mounting and apply a rust preventive when machine operation is suspended for a long time
	Premature flaking of raceways and rolling elements	Insufficient clearance, excessive load, improper lubricant, rust, etc.	Select proper fit, bearing clearance, and lubricant
	Premature flaking of duplex bearing	Excessive preload	Adjust the preload
Scoring and Smearing	Scoring or smearing between raceway and rolling surfaces	Inadequate initial lubrication, excessively hard grease and high acceleration in starting	Use a softer grease and avoid rapid acceleration
	Spiral scoring or smearing of raceway surface of thrust ball bearing	Raceway rings are not parallel and excessive speed	Correct the mounting, apply a preload, or select another bearing type
	Scoring or smearing between the end face of the rollers and guide rib	Inadequate lubrication, incorrect mounting and large axial load	Select proper lubricants and modify the mounting
Cracks	Crack in outer or inner ring	Excessive shock load, excessive interference fit, incorrect shaft cylindricity, improper amount of sleeve taper, large fillet radius, development of thermal cracks and advancement of flaking	Examine the loading conditions, modify the fit of bearing sleeve. The fillet radius must be smaller than the bearing chamfer
	Crack in rolling element. Break in rib	Advancement of flaking, shock applied to the rib during mounting or dropped during handling	Be careful in handling and mounting
	Fracture of cage	Abnormal loading of cage due to incorrect mounting and improper lubrication	Reduce the mounting error and review the lubricating method and lubricant
Indentation	Indentations on raceway in same pattern as rolling elements	Shock load during mounting or excessive load when not rotating	Use care in handling
	Indentations on raceway and rolling elements	Foreign matter such as metallic chips or sand	Clean the housing, improve the seals, and use a clean lubricant
Abnormal Wear	False brinelling (phenomenon similar to brinelling)	Vibration of the bearing without rotation during shipment or rocking motion of small amplitude	Secure the shaft and housing, use oil as a lubricant and reduce vibration by applying a preload
	Fretting	Slight wearing of the fitting surface	Increase interference and apply oil
	Wearing of raceway, rolling elements, rib and cage	Penetration by foreign matter, incorrect lubrication, and rust	Use a different type of seal, clean the housing, and use a clean lubricant
	Creep	Insufficient interference or insufficient tightening of sleeve	Modify the fit or tighten the sleeve
Seizure	Discoloration or welding of raceway, rolling elements, and rib	Insufficient clearance, incorrect lubrication, or improper mounting	Review the internal clearance and bearing fit, supply an adequate amount of the proper lubricant and improve the mounting method and related parts
Electric Burns	Fluting or corrugation or insulate the bearing	Melting due to electric arcing	Install a ground wire to stop flow of electricity
Corrosion and Rust	Rust and corrosion of fitting surfaces and bearing interior	Condensation of water from the air, fretting, or penetration by corrosive substances	Use care in storing and avoid high temperatures and high humidity; treatment for rust prevention is necessary when the operation is suspended for a long time
